Each capacitor has the big surfaces and imperfect insulator between them.
Is it the "DC coupling to discharge  static electricity"?

" You have a big problem with comprehending, don't you?"

You think "a chassis" is "earth connection"?
What is your definition of "earth connection"?

>> Some antenna systems do have an earth connection, many don't.
>
> All must have.

You are being told NO, by people that know what they are talking about,
and you, the ultimate nitwit, are insisting that it is wrong?

If so, why are you asking the question at all?

>>Some have them in order to work correctly, some have them for protection

# Hello Ian,
#
# So the earth is necessary in your radio for the static reasons.
# In my also:
# "In the lower half of the mast, there was a vertical steel tube, attached
```

```
to
# the mast's outer structure with large insulators. This tube was grounded
at
# the bottom, and connected electrically to the mast structure by an
# adjustable metal bar at 328 metres.[2] This technique allowed adjusting
the
# impedance of the mast for the transmitter and worked by applying a DC
ground
# at a point of low radiofrequency voltage, to conduct static charge to
ground
# without diminishing the radio energy. Static electrical charge can build
up
# to high values, even at times of no thunderstorm activity, when such tall
# structures are insulated from ground. Use of this technique provides
better
# lightning protection than using just a spark gap at the mast feed, as is
# standard at most mast radiators insulated against ground."
# From: http://en.wikipedia.org/wiki/Warsaw_radio_tower
#
# It seems to me that the same reasons were in Marconi times.
#
# So I repeat my question:
#
# ""The necessity or utility of the earth connection has been sometimes
# questioned, but in my opinion no practical system of wireless telegraphy
# exists
# where the instruments are not connected to earth."(Marconi in 1909).
#
# It is still true?
# S*

The answer is still NO.  As pointed out by several others, there are
gazillions of radios operating without an "earth ground".

If one wants to connect an antenna to ground for lightning protection
reasons, that has nothing at all to do with antenna radiation.

>
> You are misinterpreting what is meant by an 'Earth Connection'. Marconi
> was referring to a direct connection to the soil, either by means of an
> earth stake or wires buried in the ground.

Marconi explained what the 'Earth Connection' is:

""By "connected to earth" I do not necessarily mean an ordinary metallic
connection as used for ordinary wire telegraphs.
The earth wire may have a condenser in series with it, or it may be
connected to what is really equivalent, a capacity area placed close to the
surface of the ground (Fig. 4).

```
It is now perfectly well known that a condenser, if large enough, does not
prevent the passage of high frequency oscillations, and therefore in these
cases the earth is for all practical purposes connected to the antennae."
>>
>> Your mobile phone  has  earth connection, radio on satellites and planes
>> have  earth connection because they are on the chassis. Accept  this and
>> move on.
>
> No they don't have an 'earth connection'. The chassis is not an 'Earth
> Connection'. Anyway it is perfectly possible the build a radio without any
> connection to a chassis whatso ever and use a balanced antenna that also
> requires no chassis or earth connection.
>
> Accept the fact that earth connections are NOT required.

Are you better than Marconi?

```

Here is the Tesla's electron gun:
http://en.wikipedia.org/wiki/File:Sp_xmtr.png

"In April 1887, Tesla began investigating what would later be called X-rays
" We now know that this device operated by emitting electrons from the
single electrode through a combination of field electron emission and
thermionic emission. Once liberated, electrons are strongly repelled by the
high electric field near the electrode during negative voltage peaks from
the oscillating HV output of the Tesla Coil, generating X rays as they
collide with the glass envelope. " From:
http://en.wikipedia.org/?title=Nikola_Tesla

So we know that the electrons are liberated from the end of antenna.
But where the electrons come from?
From: "the earth"?
S*

Marconi made an incorrect claim, a claim we now know that is not true.
So, now we are better than Marconi be cause we all (except you) know that.
But that is not surprising after a century of evolution, isn't it.

I wworked for 6 momths for a company that manufactured thin-film optical
filters.

The glass pieces were placed ina vacuum chamber. along with the
crucible(s) with the coating material(s).

Once the chamber was evacuated an electron beam was used to heat the
coating materials, which usually sublimed and were directed magneticaly

to the glass.

I still have one of the electron guns (filament burned out). It looks
like an oversized tube with an open ended glass tube on one side where
the beam was directed out.

So "we" know from you that todays antennas do not liberate even one
electron.

Antennas liberate the EM waves and the electrons as a by product.
Do you support this?

Antennas liberated the EM waves and the electrons.
More electrons is liberated more electrons is flowing in the antenna.

EM travel in space. Electrons fall down on the earth.
For this reason the earth is necessary.
Do you agree?

Hello again Szczepan.

The "static to earth" in my HF aerial is merely to get the static to bypass
my receiver. The earth connection is not necessary in order to receive

signals.

Gordon Bussey, in his book "Marconi's Atlantic Leap", discusses aerials used by Marconi at Poldhu and St John's. He suspects they could well have been capacitive or inductive (page 68). His book is published by Marconi Communications.

I'd certainly prefer to use resonant aerials rather than have a mis-match into a capacitive or inductive aerial. Sometimes the option to use a resonant aerial is not available for me - such as on 160m.

I have a recollection that Marconi didn't (or couldn't) determine the wavelength / frequency he was using. This makes it difficult for us to accurately determine the match or mis-match of his aerials and radios. I also recall debate in the 1970s as to whether the three dots really had been received or had been imagined. There was conjecture that the aerials and frequency used probably used would not propagate across the Atlantic successfully.

Look at Baird. He demonstrated successful transmissions of moving pictures via radio. It worked (and I believe it offered colour and 3D) but it soon became obsolete due to the superior EMI system. Similarly, Marconi demonstrated the practical use of wireless by keying a spark transmitter. These days we no longer use spark (and we do a lot more with a radio signal then key it on and off).

It also has to be remembered that Marconi brought a lot of existing technology together to form wireless / radio. For example, according to Wikipedia induction coils date back to Faraday and Ruhmkorff.

So, no, an earth is not necessary to transmit and receive radio signals. Was Marconi wrong? Let's say that he could (and probably would) have done better if he understood radio as we understand it to-day.

Kindest regards, Ian.

Balakrishna=92s new latest movie is =93Adhinayakudu=94. This songs was
released. All songs are very excellent.
Adhinayakudu full movie free download here. Nandamuri fans are
enjoying to listen this songs. Balakrishan is
looking very different in this film. He is playing three different
roles in this movie. His old getup looking good.
```

Definitely balakrishna will take big hit with this film. Already this movie trailer was released.
This is family entertainer with action movie. Adhinayakudu movie free download

Dammu movie will release on April 20th. Director Boyapati srinu was announced the date. Kartheeka performance is very hot in the film.
This is first film to
kartheeka act with Ntr. Trisha also looking hot. Boyapati srinu is taking so much of caring about this film. Definitely this movie will break the collections.
Dammu movie free download here.

# Antennas liberated the EM waves and the electrons.
# More electrons is liberated more electrons is flowing in the antenna.
#
# EM travel in space. Electrons fall down on the earth.
# For this reason the earth is necessary.
# Do you agree?
# S*

No.  There is a current minimum at the end of an antenna because there is no
place for electrons to flow.

Hello Ian,

See the topic "Electron gun".

Each antenna liberate EM waves, heat and electrons.
At the end of the mast the voltage is dobled and the "field emmision" works.

The heat is no problem but the escaping of electrons is a problem.
Tesla discovered that the one end of the dipole must be earthed to have the strong waves.

That should be obvious for you.

"The earth connection is not necessary in order to receive signals."

It is necessery to transmit and to receive.
You have it: "The "static to earth" in my HF aerial is merely to get the static to bypass
 my receiver".

The liberating of electrons by a transmitter and absorbing by a receiver is a by products of antennas.
The "earth connection" is a remedy.

Best Regards,
S*

All who know what the "field electron emission" is.

"Introduction.-The  main  features of  t h e  phenomenon  of  the
extraction
of  ele&ons  from  cold  metals  b y  intense  electric fields  are well
known,"
From:
http://www-project.slac.stanford.edu/lc/wkshp/RFBreakdwn/references/fowler.pdf

Each  metal with the excess of electrons liberate them.
```

A transmitter antena liberates radio waves, heat and electrons.

Waves travel in space, heat is dissipated and electrons are taken from the earth.

> my receiver".
>
> The liberating of electrons by a transmitter and absorbing by a receiver is
> a by products of antennas.

There are no electrons "liberated" on a transmitting antenna unless
something is arcing and it is an abnormal condition.

There are no electron absorbed by a receiving antenna.

You are a babbling idiot.

> The "earth connection" is a remedy.

Only if that "earth connection" is you 6 feet under it.

We, being anyone with any knowledge of electromagnetics, know that
antennas do not liberate or emit any electrons under normal conditions,
either today or any time in history.

If an antenna is emitting electrons, something is arcing, which is NOT
a normal or necessary for radio transmission.

> Antennas liberate the EM waves and the electrons as a by product.

No, they do not under normal conditions, now or ever.

> Do you support this?

Of course not as it is babbling gibberish.

Tesla was playing with Tesla coils and extremely high voltages which
produced RF energy as a by product.

Producing RF energy through arcs and sparks is a technology that was abandoned about 100 years ago.

Hello again Szczepan.
I'm sorry to say that I didn't understand this part of your posting:
"Each antenna liberate EM waves, heat and electrons.At the end of the mast
the voltage is dobled and the "field emmision" works. The heat is no problem
but the escaping of electrons is a problem."
Do you mean "mast" or "aerial" when you say that the voltage is dobled
(sic)?

"Tesla discovered that the one end of the dipole must be earthed to have the
strong waves."
This is definitely something that I will not be doing. A dipole has low
impedance at the feed point and high impedance at its ends.

Best wishes, Ian.

Hello Bill.  Thanks - you said it and I thought it. He seems to copy phrases
and paste them without understanding what they mean.
I still reckon we had a good discussion about aerials.

Regards, Ian.

What happens on antennas is NOT "field electron emission" by the modern
definition of the term.

Corona discharge is something else, related, but something else.

Hello chaps.
Several of you have said that Szczepan seems unable to accept new ideas.

I see that he persists in believing Marconi's comment that an earth connection is necessary. Those of us who use Yagi , loop or dipole aerials know, through experience, that an earth connection is not necessary.
I am undecided why he prefers to believe the opinion of someone who worked in the early days of radio rather than those of us who use radio in modern times.

I feel it is awkward to say that Marconi was wrong even though we now know this is the case. Personally, I'd say that Marconi's opinion that "no practical system of wireless telegraphy exists where the instruments are not connected to earth" obviously related to his own use of wireless. As I understand it, Marconi's aerials were not resonant at the frequency he was using. They would therefore be a mis-match to his radios and this situation was alleviated by using connections to earth.

I find it puzzling that Szczepan feels happy to ignore our comments and continue to accept Marconi's opinion given that he (Szczepan) said that a transmitter is a "black box" to him. I've speculated that his English may

not be very good but I shall be amused if we find out that his first
language is English despite his non-English name.
He never answered my question about resonant / non-resonant aerials so I
guess his technical knowledge is limited.

Kindest regards to all,
Ian.

ps: If Szczepan is happy to constrain his knowledge to the days of Marconi
then I wonder how come he is using a computer. Didn't have those in the days
of Marconi.

Yet they do not.

> See Fig. 2: http://www.antiquewireless.org/otb/lodge1102.htm

Why?

A lot more has been learned since 1887.

<snip>

> Can you measure the static electricity?

Sure, with a static meter.

Yet another device that didn't exist in 1887.

> You will transmit just fine if you have the ground/chassis/counterpoise.

It depends on the type of antenna.

If it is a dipole, yagi, log-periodic, sturba curtain, rhombic, parabolic,
helix, loop, cubical quad, on any of many, many more types of antennas
that have no place or need to connect a ground, it would not.

No.

You did not read the material.

From http://en.wikipedia.org/wiki/Field_electron_emission

"Field emission in pure metals occurs in high electric fields: the gradients
are typically higher than 1 gigavolt per metre and strongly dependent upon
the work function."

Do you have any clue what it takes to get a gradient of 1 gigavolt per metre?

Little of the technology in use today was known in Marconi's time.

Marconi knew nothing of resonance, impedance, or electromagnetic field
theory; it all came after his time.

Marconi would have been totally baffled if shown a helical, slot, yagi,
or any number of antennas invented after his time in common use today.

The only reference antenna Marconi had was a wire of some sort fed against
ground.

For that particular type of antenna, Marconi was correct, but his statement
is NOT correct for antennas in general.

Hello again.

I bet that Marconi would have been very wiling to learn about new theory and
technology ... unlike some people.

Regards, Ian.

I would also bet Marconi would not stubornly cling to something said a 100
years before his time as being absolutely correct.

# years before his time as being absolutely correct.

IMHO the guy is just jerking your chain by deliberately being dense.  The
questions are nonsensical and remind me of that old "Eliza" software that
would take your words and run you around in endless circles.

It doesn't matter. 12v is 12v.. But to answer your question,
I open the hood of the car, and attach the wires to the battery
while it's in the car. That way I can start the car to charge
the battery every once in a while.
But the power source of the radio has nothing whatsoever to do with
the antenna. I could place the battery anywhere and the operation would
be the same. The car is not part of the antenna. The *complete* antenna
is suspended between a couple of oak trees well over my head.
The antenna is decoupled from the feed line. And there are no
connections to ground. One could consider the negative power lead
as connecting to a "chassis", IE: the body of the car, but that is
a DC connection, not RF.
Moving the battery would make no difference whatsoever in the
performance of the antenna.

Hello Wayne.

Your humble opinion is correct. The argument has indeed gone in circles.
Sometimes I wonder if he's using a translation engine to handle English.

Regards, Ian.

Hello again.

I agree. I'm sure that Marconi was bright enough to investigate new ideas. I
was at a social event with his widow and daughter a long time ago but there
wasn't

time to ask her about him.

Regards, Ian.

I guess all the people I talk to using that portable rig
are just a figment of my imagination?
And likewise here at the house where most of my systems are
ungrounded..
It's actually quite astounding.. I've worked about 29
zillion people using various ungrounded antenna systems that don't work.

How did I pull off such a feat? Did I scream real loud?
Did I hire R. Lee Ermey to scream for me? He's pretty good at it..
Maybe I built a big fire behind the radio, and sent smoke signals..
I suppose that could be a viable explanation, being as that land was
Indian Territory until a couple of years before Marconi made that
statement. :\
I don't own any war drums, so we would have to rule those out.. :|
Maybe I pass notes around the country on the backs of tarantulas..
They usually don't mind as long as I don't use a hat pin to attach
the notes to their backs.

are just a figment of my imagination?
<snip>

Nope. Not at all. I have quite a few contacts with a Heathkit HW-7 powered with 8 "D" cells, a homebrew balanced tuner and open wire dipole. This was use on board a sailboat.

"Would" means that you are not sure.

If you want to be sure you can make the two experimments:

1. Take off the car battery and sit it on the stone bench, and/or

2. Instal the ammeters on the each wires to the battery while it's in the car.

Would be nice to know the results.
Best Regards,
S*

It contradicts to the known phenomenon that each charged body lost its
charge in a short time. AT EACH VOLTAGE.

So your claim is that it is sufficient to "have the chassis" and that
this chassis does not have to be connected to the earth?

What constitutes "the chassis"?
Do you have any minimum size for the chassis to be a chassis?

". In electronic circuit theory, a "ground" is usually idealized as an infinite source or sink for charge, which can absorb an unlimited amount of current without changing its potential. Where a real ground connection has a significant resistance, the approximation of zero potential is no longer valid. Stray voltages or earth potential rise effects will occur, which may create noise in signals or if large enough will produce an electric shock hazard.
The use of the term ground (or earth) is so common in electrical and electronics applications that circuits in portable electronic devices such as cell phones and media players as well as circuits in vehicles such as ships, aircraft, and spacecraft may be spoken of as having a "ground" connection without any actual connection to the Earth. This is usually a large conductor attached to one side of the power supply (such as the "ground plane" on a printed circuit board) which serves as the common return path for current from many different components in the circuit." From:
http://en.wikipedia.org/wiki/Ground_(electricity)

There is wrote that all of your transmitter have "a "ground" connection without any actual connection to the Earth."

Each transmitter needs " an infinite source or sink for charge".

The above you know.

But some of you do not know that where the voltage is there is the field electron emission. So the sink is necessary.

It must not be infinite. "a large conductor" absorb the electrons from the air. So its size must be adequate to the emission.

Nice Fun.

I know that it is not true.
A transmitter needs no infinite source or sink for charge because it
does not generate any DC current into the antenna.

Ok so we can finally rest the case and agree that a connection to

earth is not required for a transmitter, something you have claimed
all the time because Marconi wrote it.

> "Would" means that you are not sure.

No, "would" means just that. And I am sure.
>
> If you want to be sure you can make the two experimments:

I'm already sure. I've run more portable stations over the
years than you can imagine. With batteries in and out of the
cars, using various types of "complete" antennas, and also
using the vertical antennas on the vehicles.
Even if I use an antenna on the vehicle, which *would*
use the car body as part of the antenna, where I have
the battery or radio makes no measurable difference in antenna
performance.
```

How does one actually measure the voltage on the ends of an antenna?

Hello chaps. Let's not worry about Szczepan's misunderstanding of the word
"would".
I like the idea of the ammeters - I think I saw something similar in a
textbook I have from the 1920s or 1930s.

Best wishes to all, Ian.

Good afternoon ladies and gentlemen.

Do any of you teach students hoping to gain an amateur radio licence?
Some of Szczepan's postings would be useful for amusing those students and
informing them how it is definitely not done.

Hope you all have a fine Wednesday,
Ian.

Hello again folks.

{I am concerned about Szczepan. He's cut-and-pasting from Wikipedia. Is he
safe with a sharp pair of scissors?}
I'm not sure whether to suggest that he also look at "chassis" and "common
point".
More seriously, I guess this is an example of a common word, "ground",
having more than one technical meaning and this bringing confusion to the
lay person.

I really wish that Szczepan would get hold of a training manual for the
amateur radio licence exams. The usual diagrams would enlighten him.

Kindest regards from a wet UK, Ian.

Ah - so there still are some articles in Wikipedia that lack technical
accuracy. The quote above demonstrates poor use of the word "ground" and
that's caused Szczepan to misunderstand.

Regards, Ian.

It is true because it generate the oscillatory flow of electrons into the
antenna.
In such case the DC ammeter idicates the current.

Marconi wrote:
""By "connected to earth" I do not necessarily mean an ordinary metallic
connection as used for ordinary wire telegraphs.
The earth wire may have a condenser in series with it, or it may be
connected to what is really equivalent, a capacity area placed close to the
surface
of the ground (Fig. 4)."

" a capacity area placed close to the surface of the ground" = " large
conductor "

The case will be ready to rest if you admit that Marconi was right in his
Nobel lecture.

It is a pity that you don't have a transmitter, or otherwise it would
be easy for you to see for yourself that you are talking nonsense!

There is no DC current from a transmitter into the antenna.

No, he was not right.  And you have described yourself what was wrong
in what he wrote.

No, they do not.

I doubt you know what the word "chassis" means.

Nope, you just don't understand what is meant.

> Each transmitter needs " an infinite source or sink for charge".

Nope.

> The above you know.
>
> But some of you do not know that where the voltage is there is the field
> electron emission. So the sink is necessary.

Meaningless babble.

> It must not be infinite. "a large conductor" absorb the electrons from the

More meaningless babble.

Antennas do not have a chassis.

In the days of wired electronics, the chassis was the metal box the equipment was built in and used as a common return, i.e. what is called ground but has no relationship to the Earth. By convention it was mearly the common connection point for the most negative voltage.

In todays world of circuit boards, there is often no chassis.

Most portable equipment these days is a circuit board in a plastic box.

No chassis.

No ground, as in to the Earth, connection.

Several replies convinced me to unPLONK him.

He is amusing and either doesn't get the responses or doesn't care.  Or
maybe he _can't_ care.

The "large conductor" works as the earth.

Actually, if you read Tom Edisons Bio - it says that he owed Tesla money

and refused to pay.
Tesla was mad at Edison and said he was so stupid, he was willing to do something wrong 100 times until he found the right answer, then to spend the money and pay someone once to show him how to do it the right way.
Tom was the one who was hard headed.
Tesla's family was the ones who benefited by his death.
They were able to settle his estate and collect what was owed to them and were well off with the money that they received after his death.

Tesla was just stuck on trying to transmit electricity.
If you think about all the money spent on telephone poles, rights of ways, copper wire etc - if he could have perfected it - it would have made him a millionaire.

I would chock it up the same as the Tucker Automobile.
It was so far ahead of everyone else - as far as technology went that no one understood it and the Big 3 refused to allow him to make it, or they would have had to comply with the standards he invented and it would have cost them money, both in sales and in market share.

It was easier to get rid of Tucker then to allow him to produce his automobile and show the world how wrong the rest of the world was.

Things like air cooled engines, seat belts, padded dash boards, recessed knobs..

My question was:
"Now is 2012. Is " this curious apparatus" the "fundamental part of modern
radio"? Of course in form of the " variations of Tesla coils and Tesla
coil circuits".

In 1924 Marx invented the High Voltage Generator without coils.
Tesla Coil is also HVG.

So I modify may question: "Are in todays transmitters "variations of Tesla coils" or the "variations of Marx generators".
Or "is possible to do the transmitter without coils"?
If Yes, when was the first?

When you are so obsessed with history, why don't you do your own research?

Asking questions here will never be useful for you because you are not
the type of man to accept any answer.

I am not "obsessed with history".

"My question was:
"Now is 2012. Is " this curious apparatus" the "fundamental part of modern
radio"? Of course in form of the " variations of Tesla coils and Tesla
coil circuits".

In 1924 Marx invented the High Voltage Generator without coils.
Tesla Coil is also HVG.

So I modify may question: "Are in today transmitters the "variations of
Tesla
coils" or the "variations of Marx generators".
Or "is possible to do the transmitter without coils"?
If Yes, when was the first?

I have never seen a transmitter (even that in a mobile phone).

I wasted a lot of time trying to build a twinlead J-pole. The problem was very limited SWR bandwidth. That's when the idea of making the radiator section thicker came to me - - check out a "Slim Jim Antenna". (I assume you will be using an SWR meter to get the feed tap right.) Good luck on your quest for materials.

Thanks for the link, Dave.  Guess I'd heard of Laport's book, but
never seen it.  Downloaded it last night, and a quick look this
morning tells me it's a very good book to learn some new things from.

Cheers,
Tom

None of the above.

Modern recievers and transmitters contain coils but by no stretch of the
imagination could they be called Tesla coils.

Yes.

Microwave transmitters routinely use resonant devices other than coils and capacitors.

Dunno.. Transmitting electricity through the air strikes me as
quite lossy, and if using a broad pattern to enable many people to use
it, the amount of recoverable energy vs what is transmitted would be
fairly small. A large amount would go off into space totally wasted.
If his method were actually practical, I suspect someone would be
using it by now on some scale.
There are enough loss just using a direct connection with wire.
I can light a florescent light bulb using the energy from my
HF mobile antenna. But only if I have the tube right next to
the antenna. Five feet away, fugettaboutit..

Exactly why the idea isn't used for anything much heavy duty than charging
a cell phone or a cordless toothbrush.

But system efficiency and losses were not something Tesla took into
concideration, nor was much thought put into how one whould charge
customers when they could have built the "receiver" end themselves
and obtained his electricity for free. Not a viable bussiness model.

>
> I wasted a lot of time trying to build a twinlead J-pole. The problem was very limited SWR bandwidth. That's when the idea of making the radiator section thicker came to me - - check out a "Slim Jim Antenna". (I assume you will be using an SWR meter to get the feed tap right.) Good luck on your quest for materials.
>
> Chuck W6PKP

I have made only a couple of twinlead j-poles. However, I have made about two dozen from copper pipe. In the course of this, I discovered that no matter what I did with the feed tap, I wasn't getting any to match 1:1 at the low point in-band. About that time, I was reading about the gamma match, whereby the 50-ohm point on one element is fed through a capacitor. The text said it served to null the natural inductance of the elements.

That was an "Aha!" moment for me. The next time I made a copper pipe J-pole, I found my same SWR issue, so after trimming for the best SWR in-band, I placed a 100 uuF cap (100 picoFarads) between connector's center pin and the long side of the J, this in place of a straight piece of wire.

Bingo!

Take it from there, gang.

"Sal"
(KD6VKW)

PS: Weatherproofing the feed point leaves you with an unsightly blob.
Tolerable; some days I, myself, am an unsightly blob.

PPS: Don't omit a choke on the feedline, close to the antenna. Otherwise,
current on the shield may give you bogus SWR meter readings. Google for
<feedline choke> or <feedline choking>.

I do the same when using the base fed 1/2 waves. But I build
them as a ringo, and use a single turn tapped coil, and a length of
coax as the capacitor. Never had any trouble getting a good match with
those. And the value of the cap or length of coax is fairly non
critical as long as you are in the basic ballpark.
Cushcraft used this design, and other variations for a lot of
half wave verticals.
Sometimes with the tapped single turn coil, you can get a decent
match with no cap, but if it's a bit high at it's lowest point, you
can add the cap.
For instance, about 16-17 inches is a good length for 10m. And I
think that is fairly close to 50 pf or so, but I'd have to check.
So for 2m, you could use 20% of that length for a good starting point,
which is about 3.5 inches. BTW, those are for RG-8 type coax..
You might have to adjust for others as far as the pf per foot.

I used to use radial sets below the half waves for decoupling.
Wide sleeves would probably be even better, but radial sets are much
easier to construct.. :/
I think most of them, I had the radial set 1/4 wave below the
feed point of the half wave element. Seemed to work fairly well.

In an apartment, I'd be about as likely to make a quick
quarter wave ground plane from stiff wire, and hang it from the
ceiling as anything.. For 2m, add a 19 inch wire to the center
conductor, slap a few wire radials to the shield and let them
slope down, stick it to the ceiling with a tack, and you are off
to the races. No matching fuss, and they work within .3 db of the
usual half wave on paper. I've got one in the attic hung from the
rafters. I think I'm using 6 radials on that one. The more radials,
the better the decoupling, if one uses no further decoupling methods
below the feed point.

Summary: Recruitment announcement for ham-radio-related FAQ articles
Keywords: FAQ, Intro, amateur, ham, radio, recruit, recruitment

Posted-By: auto-faq 3.3.2 beta (PGPMoose V2.0, Perl 5.005)
Archive-name: radio/ham-radio/recruitment
Revision: 1.2 2009/11/25 14:41:01
Posting-Frequency: posted monthly
URL: http://www.faqs.org/faqs/radio/personal-intro/
```

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been recently revived by an active moderation team. We are currently seeking suitable information, FAQ, and bulletin articles from the entire rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our newsgroup.

We are seeking a replacement maintainer for the following information bulletin formerly posted to rec.radio.amateur.* (and currently archived

```
at http://www.faqs.org/faqs/radio/personal-intro/ ):

 radio/personal-intro
 Subject: Guide to the rec.radio Newsgroups
 Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
 Last Posted: 9 Nov 2001 06:18:17 GMT
 Posting-Frequency: 15th of each month

One significant omission, requiring immediate updates, for this article       |
is that it does not mention newer amateur radio newsgroups created since      |
it was written, including:                                                    |

 rec.radio.amateur.antenna                                                    |
 rec.radio.amateur.boatanchors                                                |
 rec.radio.amateur.dx                                                         |
 rec.radio.amateur.equipment                                                  |
 rec.radio.amateur.homebrew                                                   |
 rec.radio.amateur.moderated                                                  |
 rec.radio.amateur.space                                                      |

We are willing to provide any technical support necessary to get this
article updated and automatically posted again at a regular interval.
This would include establishing contact with the original maintainer for
any necessary permissions.  We would prefer to seek a new, dedicated
maintainer at this time, rather than start auto-posting the original
article ourselves.

For more information about our newsgroup, see:

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to
rec-radio-info-request@panix.com.

Yes. It was impossible to "make" the microwave frequency using coils.
Magnetrons are for it.

But are the modern radio waves (ham) transmitters without any coils?

A coil is made of a wire.
Are  "magnetrons" or simmilar device for yours transmitters?

No, it is not "impossible", just more difficult the higher in frequency
you go.

At lower microwave frequencies it is a coin toss whether to use coils
and capacitors or other things.

> Magnetrons are for it.

Magnetrons are not relevevant to the question.

> But are the modern radio waves (ham) transmitters without any coils?
> S*

It is possible, at least at low HF, but not practical in general.

You are babbling.

Well, usually but not necessarily.
```

> Are "magnetrons" or simmilar device for yours transmitters?

Magnetrons are microwave oscillators and impractical to build much below
1 GHz.

Magnetrons have nothing to do with coils of any kind.

You are babbling.

Jeff is right, inductance would be the correct term but you want a coil made
of wire...Well what do you call a strip line used in VHF & UHF & beyond in
Ham Transmitters...I'm referring to a straight piece of wire (strip line)

```
that is not a coil & has no turns....Now you have your answer, it is
possible & is done with no coils...Howard K0ACF

The word is inductor. At certain frequencies inductors take the form of coils. At high UHF the inductors take the form of hairpins (aka Bobby pins) a half of a loop.

Tesla lives in every old car with a distributor

More like a switch mode power supply than a crystal oscillator, (the way
I visualize a modern AM transmitter without large coils.)

Since you haven't a clue what he is talking about, your question is
meaningless.

Most current, modern transmitters, amateur or otherwise, generate their
carrier frequency through digital frequency synthesizers referenced to
a crystal oscillator.

A small percentage of transmitters that are designed for either fixed
```

frequency use or use over a limited frequency range just use crystal oscillators.

The output power is produced by amplifier stages to raise the level to the desired output.

If there were no regulations, that would be the end of it, but since there are regulations on spectral purity of transmitters, there are resonant circuits somewhere before the antenna to ensure no spurious frequencies are transmitted at a significant level.

Below microwave frequencies the resonant circuits are almost always made of discreet inductors and capacitors forming either band pass or low pass filters.

Do you realize you are getting led down the garden path? I've been following his participation (if you can call it that) in various discussions for quite some time. I don't think he even as a license. He can almost always be counted upon to totally disrupt an intelligent thread with stupid questions and will continue to do so as long as he can suck in a few responses.

Just ignore him for a while and he'll go away.

Not being led anywhere.

Our little babbling idiot spent a lot of time on the sci.phyics.* groups
where he was no better than he is here and his reception was a lot less
friendly.
```

He does not have a license of any kind and apparently not much of an education of any kind other than skimming historical articles on Wiki.

His contact with the real world and every having seen any modern technology of any kind also appears to be extremly limited.

Hi is obsessed with historical stuff, primarily dating from the pre-WWI era.

He is incapable of understanding that any major historical player could have possibly not fully understood everything and have published something that later science has shown to be incorrect.

He can not understand that people like Maxwell, Tesla, Edison, etc. had no access to things that are common today like oscilloscopes, time domain reflectometers, spectrum analyzers, etc.

In summary, he is a babbling idiot.

The problem is most people when they first encounter him treat him like an ernest newbee needing help instead of the fixated idiot he is.

Thanks for the support. I was beginning to wonder if I was the
only one thinking of him that way. I don't like to think bad of
anyone, but this guy is just a pest! I hated to see others trying
to explain something to him knowing it would just go to waste.

A few of us might recall another guy. I do
Remember his name, but actually mentioning
The name might conjure up his presence.

Usually, he offered some fancilful ideas with
No sound theories to back them up. Some were
Wacky and some were merely odd. He came
In here about twice a month. He has
Not been around for quite some time.

i live in an apt, roof is about 200ft up i have several center fed
dipoles, a end fed /sleve dipole,   i also had a small multiband beam
all worked great   dipoles were fantastic

good luck

I asked:
"Tesla coil circuits were used commercially in sparkgap radio transmitters
for wireless telegraphy until the 1920s,[1"
From: http://en.wikipedia.org/wiki/DRSSTC

But in 1929 was wrote: "It is not generally appreciated that this curious
apparatus, often associated with pretty or spectacular demonstrations of
high voltage electricity, is really a fundamental part of modern radio. For
all the tuning apparatus and circuits in every transmitting and receiving
set are simply variations of Tesla coils and Tesla coil circuits".
From: http://www.tfcbooks.com/tesla/1929-09-22.htm

Now is 2012. Is " this curious apparatus" the "fundamental part of modern
radio"? Of course in form of the " variations of Tesla coils and Tesla
coil circuits".
S* "

Now I know the opinions of radio amateurs.

> Just ignore him for a while and he'll go away.

Sometimes I must ask the experts.
What is wrong in that?

Pilots have no trouble using radios at 45,000 ft.
I've never yet seen one require a ground wire.

"Houston, Tranquility Base here. The Eagle has landed,
and we are talking to you via radio, even though we
are not connected to earth, and Marconi said it would
lead to celestial mayhem if we were to even try."

Houston, I we have a problem...

It obviously never was true.  My guess is that the reasoning at the time
stemmed from a lack of understanding of far-field electromagnetic wave
propagation (and electromagnetics in general), failure to construct
apparati of sufficient sensitivity due to technology limitations, and
inefficient antenna designs (relative to using the earth as a
counterpoise.)  I also think Nikola Tesla failed to grasp these concepts
as well.  Sincerely, and 73s from N4GGO,

I hope you have your GSM phone firmly connected to earth, or it would
operate in violation of Marconi's observations.

Not to mention modern quantum electrodynamics theory.

In the back of the plane there is a small bucket of soil with a ground
rod stuck in it. At each stop they check to make sure the soil is
damp enough to provide sufficient conductivity. On occasion a
little salt is added. The ground rod is connected to the frame of
the plane using an MFJ Artificial Ground to further ensure that
all is well. As well, the bucket is grounded to prevent any
possible cathodic action from interfering with the system.

Marconi added:
"By "connected to earth" I do not necessarily mean an ordinary metallic
connection as used for ordinary wire telegraphs.
The earth wire may have a condenser in series with it, or it may be
connected to what is really equivalent, a capacity area placed close to the
surface
of the ground (Fig. 4).

```
It is now perfectly well known that a condenser, if large enough, does not
prevent the passage of high frequency oscillations, and therefore in these
cases
the earth is for all practical purposes connected to the antennae."

So the plane is "connected to earth".
Is Marconi right?

Asked and answered.

NO.

Tesla coils have not been part of ANY transmitter built since before WWII.

Tesla coils have not been part of ANY transmitter built since before WWII.

Tesla coils have not been part of ANY transmitter built since before WWII.

It was NEVER true; Marconi was wrong.

Here's a news flash for you:

A lot has been learned about radio since Marconi.

The radios on Pioneer 10 worked just fine 12,000,000,000 km from the Earth.

Chassis = the ground.
Is it true?
S*
**********************
No.  Spacecraft have no connection to ground, and it is possible to feed
balanced antennas in a fashion that there is no ground connection.

A mobile device uses the user as the counterpoise.
A vehicle is not physically bonded to the earth - yet still works.
A Mag Mount antenna is not physically bonded to the vehicle body - hence it uses a loop radio to antenna antenna to radio and it changes the way the coax interacts with the antenna.
If the radio is bonded to the body and the antenna is bonded to the body the body is capacitive. Turns the whole body into one big counterpoise.

Maybe this is the reason why a 102 inch whip works better then a mag mount antenna or one of those silly dual sticks on a truckers mirrors...

Such a question would only be asked by someone who is unaware of radio communications by handhelds or by radios in vehicles, aircraft or spacecraft. In other words, no sentient person should ask it.

I'm plonking this troll, this goon, this rimless zero.

Of course, you can play with him if you wish ... but serious discourse? Ha!

Balanced antennas such as dipoles do not require a "counterpoise".

Incorrect. The antennas used do not need a counterpoise. In fact the
user is often a hindrance to the antenna working properly.

Nice work Sal

Thats what I am talking about. I knew you had it in ya.

I decided to buy a smart charger, the

http://www.adorama.com/ANCE8.html?utm_term=Other&utm_medium=Shopping%20Site&utm_campaign=Other&utm_source=dealtime

I bought it from a different source at much cheaper the price online including shipping to my door.

While my other rigs are 1970ish, the HT is mostly for local stuff, the boat, the company channels, the marine band and the grs bands. Very handy actually, and practical because programable for a lot of uses. Once it was opened up.

Thanks for the feedback, sorry for the off topic question and always appreciate your expertise on here. 73s

My apologies for the group that used to be here.

Many of the people answering lately are not hams.

Those that are will show their calls. Those that hide are not hams.

I didn't listen to it for long, but long enough to see that it had no merit.

But, do you think the average ham has a sound understanding?

What about Wikipedia... here is a little extract:

"SWR is used as an efficiency measure for transmission lines, electrical cables that conduct radio frequency signals, used for purposes such as connecting radio transmitters and receivers with their antennas, and distributing cable television signals. A problem with transmission lines is that impedance mismatches in the cable tend to reflect the radio waves back toward the source end of the cable, preventing all the power from reaching the destination end. SWR measures the relative size of these reflections. An ideal transmission line would have an SWR of 1:1, with all the power reaching the destination and no reflected power. An infinite SWR represents complete reflection, with all the power reflected back down the cable. The SWR of a transmission line can be measured with an instrument called an SWR meter, and checking the SWR is a standard part of installing and maintaining transmission lines."

So, from the quote "SWR measures the relative size of those reflections", and when there is no reflection, the "line would have an SWR of 1:1". It is internally inconsistent. This is just as flawed as the videos example of a "radio doin' 10W and only 8W gettin' out, then you have a signal wave ratio of 1.2".

Now, Widipedia started with a fairly correct statement "standing wave ratio (SWR) is the ratio of the amplitude of a partial standing wave at an antinode (maximum) to the amplitude at an adjacent node (minimum), in an electrical transmission line", just someone had to expand that and turn it into gobbledegook.

No wonder people get confused.

And Wiki having given a common formula for VSWR(rho) looks like they considers only a subset of real transmission lines, a rare subset at that, distortionless lines, when they say "As rho, the magnitude of

Gamma, always falls in the range [0,1], the VSWR is always >= +1."
(Gamma is a complex quantity, yet they specify the range in scalar
terms, and it is wrong.)

The difference between hams and chooks is probably one of degree, and
becoming less with passage of time.

Owen

Maybe he needs the batteries for his sauna.

Hi David

Batteries for my sauna? Now I never thought about that. 6000 watts ? Now that is awsome.

I am afraid that the gnd radiation from the granite rocks I used might interfere with the pulse charging action of today's smart chargers.

But I wonder how many AA batteries would have to be used inline to deliver 6000 watts for about an hours sauna?

You tell me that David and I will tip my hat to ya.

Hi Tom

Thanks for the comment. But I respectully disagree. While I have qso with some of (in my opinion) the most intelligent people I can talk with on the HF and VHF bands. Especially on the HF bands because you must identify yourself regularly. However on the internet I find when you have a conversation with someone they are always asking you what color underwear you are wearing or something stupid like that. Not the same as on my HF rigs. I prefer the HF to the internet anyday. However, I do use this group as a resource for information, my server doesn't give me many newsgroups related to the questions I have asked. But if I ask the question, I get 10 responses, and half of them are flinging mud at me, the other half some useful information I feel good. And I am thankful. And I still say there is a lot of intelligence in here, and I love it.

I learned more about batteries this last week and today's way of dealing with them and I know many readers here did also. Big win win. Crazy thing is, I just refreshed my memory as I learned all this long ago, but forgot it. Damn for braincell degeneration. Anyone recommend anything for that? Scotch and vodka and vitamin b doesn't work. I can contest to that.

But back to your opinion of identifying yourself each time, and identifying yourself entirely. Remember those 50% who fling mud? Well they are capable of anything these days and anonamously throwing rocks through your windows late at night is possible with some of these wackos. So the reason some don't identify themselves all the time may not be because they are not hams, they just want annonamity (spelling?) to keep their guard up as this internet really brings out the worst in some people.

Well, maybe. I don't have a defined sig with my call. I mention my call
periodically in case anybody wants to do a lookup.

I am going to move in a few months to a new apartment. The best antenna I can put up that I know of at this time is a twinlead J-pole. I need to put up several of them, due to the different aspects of the apartment and buildings being in between some windows and others.

I need advice on sources for the following that will take internet orders, preferaby with paypal and send the items to Israel:

1. 300 ohm CLEAR twin lead. I would prefer current manufacture (assuming it is still made) than 20 year old new old stock (NOS).

   25 feet would be enough, but if I had to, I would buy 50 or 100.

2. Thin coax, such as RG-174, preferably in white.

3. Connectors for the coax. BNC would be best. I have tools to apply compression connectors such as used for RG-6, but I have never seen a compression connector for RG-174. Even compression F connectors would be good.

   If I can't buy them, then lengths of RG-174 with the connectors already in place would be a ok, but I expect expensive.

Thanks in advance and 73,

Geoff.

Summary: Short reminder for unmoderated newsgroups that crossposting is permitted
Keywords: FAQ, ham, amateur, radio, moderated, unmoderated, crossposting,
permitted

Posted-By: auto-faq 3.3.2 beta (PGPMoose V2.0, Perl 5.005)
Archive-name: radio/ham-radio/moderated/crossposting
Revision: 1.2 2011/11/02 04:08:53
Posting-Frequency: posted monthly
URL: http://www.panix.com/~rram/usenet/rram/index.html

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader
opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/
d7d337db35f23326

the rec.radio.amateur.moderated Moderation Team had decided to consider |
amending its charter, and permit limited simultaneous crossposting to
rec.radio.amateur.moderated and one other unmoderated
amateur-radio-related discussion newsgroup. After a successful trial |
period (90 days, through early July 2009), we decided to adopt this |
change permanently. |

Approved rec.radio.amateur.* newsgroups are those that are currently
listed in the latest version of the "List of Big Eight Newsgroups" which
is crossposted monthly to news.announce.newgroups, news.groups, and
news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those that have been created consistent with the suggestions in "So You Want to Create an Alt Newsgroup" at:

  http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either "radio.amateur" or "ham-radio" in their names, including uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may still choose to reject articles crossposted to any alt.* newsgroup with an inappropriate name, including obscene language, embedded name-calling, or encouragement of unlawful conduct.

Please direct any comments, questions, or criticisms to rec-radio-amateur-moderated-request@panix.com.

RG-188a/u or Belden 83269 is the PTFE version of RG-174, which usually
has a white outer PTFE jacket.
<http://www.belden.com/techdatas/metric/83269.pdf>
<http://www.ebay.com/itm/130669565253>

The most common crimp connector for RG-174 is an SMA.  BNC is also
available.  Plenty of both on eBay.

Buy an assortment of crimpers, so you can make your own cables:
<http://802.11junk.com/jeffl/antennas/Misc/slides/crimpers.html>
The green handles are HT-336G crimpers.

I see some on eBay right now... reportedly LEVITON 003-X3300-100,
"new" (dunno if it's freshmade or NOS). Auction 350494793319.

Neither Newark nor Allied seem to carry this stuff in their wire
catalogs any more, as far as I can tell.

>2. Thin coax, such as RG-174, preferably in white.

I'm not sure I've seen RF coax that small, in white. I've seen some
with a clear, or clear-golden outer jacket, through which the silver
braid can be seen... in fact I think I've got a spool of each of these
types. It's fairly stiff compared to a vinyl-jacketed coax of the
same size.

L-com.com and others have these... googling "RG-174 crimp BNC" turns
up numerous sources.

Gotta love eBay, only sold "Buy It Now" for $65/100 feet or $.65 a foot.

Plus they only ship to the US.

:-(

Geoff.

Think about it - Net time - those old hams - their knobs are set in
stone and they refuse to operate except on that one frequency.
It might as well be channelized.
40 meters - most people won't even turn the knob and you almost never
hear anyone yelling CQ - because the net people has their own little
channel where they talk and when they are done talking - they shut the
radio off.
20 meters on the weekend and evenings is just as bad.

10 meters is so quiet - the only people you get to talk to most times is
someone from somewhere else.
Then when the retarded contests comes along - you can barely find a
place to talk between 28.300 and 28.500 mhz.

80 and 160 meters at night is just as bad.
All the cussing and swearing and sex talk going on.

Then you have these new hams - the ones with the cell phones, the
internet and walkie talkies - because they do not understand how
transmitting works and they refuse to spend any money.

At the same time - you can't buy used equipment anymore, because the
vultures scarfs up all the used equipment they can find from the SK
hams.
Half the times it is sold on flea bay for more then it is worth!

The quality of people - with the CB radio crowd and kids taking it over
- it might as well be CB radio.
You can't teach people who's ears are closed and mouths are open.

At the same time, the doors on the old hams houses might as well be made
out of solid steel - because very few people gets into their shacks and
you definitely don't get to talk on their equipment.

Because the old hams refuses to teach the new hams, and because some of
the old hams are lousy LIDS and doesn't know how to operate in the first
place - nothing is being taught.

Its hard to teach ham radio to these people who's only radio is a hand
held.
What is there for them to learn except how to program it.

I haven't seen it that way over 50+ years of hamming. What I have seen are hams off pursuing their own particular technical interests. Some ragchew on one frequency on 75, and others are always working on moonbounce antennas, etc. Some are heavily involved in clubs and examinations.

You'll find a diversity of activites among hams throughout the years if you look at the overall picture.

I guess you would know, being as you call yourself the "channel jumper"...   :/

> 40 meters - most people won't even turn the knob and you almost never

Well, of course... I never call CQ on phone.. Only pikers and
people with bad radio breath need to call CQ on phone..

> 20 meters on the weekend and evenings is just as bad.

People have been known to turn off their radios after
operation for years and years..

>
> 10 meters is so quiet - the only people you get to talk to most times is

Well now.. lets see 28.300-28.500.. That's the old "novice"
phone band. Which is a fairly tiny sliver of 10m.
I guess it never occurred to you to maybe bump it up the
band a bit?
>
> 80 and 160 meters at night is just as bad.
> All the cussing and swearing and sex talk going on.

BS.. You will hear very little of this on 160m..
And not nearly as much as you might think on 75..
>
> Then you have these new hams - the ones with the cell phones, the
> internet and walkie talkies - because they do not understand how
> transmitting works and they refuse to spend any money.

What about them? As long as they don't bother me, I could care
less what they do. If they want to prowl the neighborhood with
a belt full of HT's, how would this effect you?

>
> At the same time - you can't buy used equipment anymore, because the
> vultures scarfs up all the used equipment they can find from the SK
> hams.

BS again.. No one is scarfing up anything unless the estate
decides to sell, and they are the ones in a position to decide
a price.

> Half the times it is sold on flea bay for more then it is worth!

Only in America is such a thing possible.. :|

>
> The quality of people - with the CB radio crowd and kids taking it over

> - it might as well be CB radio.

It's obvious that you really don't have a clue.. CB radio crowd?
There is no CB radio crowd, and there hasn't been a CB radio crowd
for many years. I listened to an old E.F. Johnson CB the other day,
when I dug one out of my vast supply of radios, and gave it away
to a friend of mine.
I didn't test it out before I took it over there, but we plugged
it in at his house. It worked. But there was no crowd on the CB
spectrum. :/ You would be lucky to hear a lost truck driver..
BTW, my friend is not a CBer per say.. He just likes to overhaul
these old radios and then sell them on flea bay for vast amounts
of money.

> You can't teach people who's ears are closed and mouths are open.

You also can't teach people who spend all their time channel
jumping..
>
> At the same time, the doors on the old hams houses might as well be made
> out of solid steel - because very few people gets into their shacks and
> you definitely don't get to talk on their equipment.

This is true. I don't want any hairy legged whiners bothering me.
My door isn't steel, but it's fairly thick wood, and I'm quite well
armed.   :) So if the door doesn't stop you, I will, when one comes
crashing through it. And I never miss.

But also, you have to consider that if you have seen one shack,
you have pretty much seen them all. :/
Also, I'm generally bored with radio at the house, and spend much more
time tinkering with and flying my 737 NG simulator these days,
than playing with all my radios.
I spend much more time on the radio when I'm at my recreational
living center, than I do at home.

>

Life is a bitch, and then some end whining about it..

>

> What is there for them to learn except how to program it.

Funny.. I had no problem learning about ham radio, even when I
had no ham radios at all.

Have you considered a Digital mode? There are still mindless babblers but
at least you don't have to hear them. I run psk31 QRP DX. If I make a QSO
it is very short and to the point.

Go to the Radio Shack website. Do a search for "fm dipole antenna".
They still sell them, and they are made of clear 300 ohm twinlead. The
one I have has about a 6-foot feeder, and a 4-foot flattop. Price is
about 7 dollars American.

May I suggest an alternative to a J-Pole? Just build a 1/2 wave vertical dipole or folded dipole. It's the same size as a J-pole, has the same gain, is easier to build, and doesn't require invisible twin-lead. Add a 1:1 coaxial balun for the simple dipole, or 4:1 for the folded dipole to reduce feed line radiation. The only real benefit to the J-pole is that it can be end mounted, which is handy for rooftop mountings. However, for tower, window, cantilevered, or creative mounting, the center mounted dipole or folded dipole is easier and batter. As an added bonus, your radiation angle will be toward the horizon, rather than towards the sky.

Hint: The bandwidth of all of the aforementioned antennas is largely

controlled by the diameter of the wire. If you're only concerned about a small part of the 2m band, then a thin wire will be just fine. If you're using high power, or want good VSWR across a wide range for frequencies, consider going to larger diameter rod or tubing.

><http://www.orionmicro.com/ant/jpole.html>

Thanks,

My reasons for choosing a J-Pole were:

1. I know how to make them and tune them.

2. The clear ones can easily be taped to a window, or glass door, so they don't
   need any holes to get out.

3. They are bottom fed, so that they can be taped to a window and the coax
   run along the wall (white) to the floor and then to the radio.

Bandwidth is not an issue, they need to be tuned for 145.025, with a
possibility of 145.250. Anything else is gravy, and unlikely to be used.

For example, I currently am using an MFJ "pocket linear" from 1996. This
is just a base loaded telescoping whip (I love Jue's marketing prose).
It sits on a small Yaseu SWR/power meter and has a 19 inch counterpoise
out the bottom.

Works great, has a low SWR and annoys everyone else in the family. So an
inivisble antenna and feedline is what I need in the new location. :-)

Geoff.

They don't ship here. :-(

Looking at eBay, the best I can do is $10 for one including postage, which just happens to be the price of 150 feet of brown twinlead without postage, from a US online vendor I found with Google.

Unfortunately the only thing I can find with Google when I search for "300 ohm clear twinlead" is articles telling you to keep twinlead clear of any obstructions, metal etc. I must be looking up to many antenna articles. :-(

Geoff.

Dipoles are easier to build and tune.

Check if you will have Low-E IR reflecting glass, which will block RF.

Try horizontally polarized. After a few bounces off buildings, the
polarization will be almost random.

>Bandwidth is not an issue, they need to be tuned for 145.025, with a

No problem. Thin wire will work.

It's difficult to build an invisible antenna. Methinks a camouflage antenna might be a better solution.

You want end fed. 2nd best would be a coaxial vertical dipole, also known as a sleeve dipole. Peel off 49cm of outer jacket from one end of a length of coaxial cable, and fold it over the cable. The exposed center conductor is the driven element. The coax cable is the other element. It's a 75 ohm antenna, so there will be some VSWR. Try to build it with some air space between the braid and the coax outer jacket. Watch the exposed coax length, as it shrinks as the braid diameter is "stretched". I build mine with RG6a/u 75 ohm coax (because it's cheap). If I'm ambitious, I put a plastic sleeve over the coax, and use aluminum duct tape over the braid.

<http://www.repeater-builder.com/antenna/pdf/qst-2009-07-coaxial-dipole.pdf>
<http://www.hamuniverse.com/vertbazooka.html>
<http://books.google.com/books?id=uxQP2Rfv44MC&pg=SA7-PA23>

Another possibility is to shrink the antenna so that it won't be so annoying. A loop antenna should suffice:
<http://users.tpg.com.au/users/ldbutler/VHFLoopAntenna.htm>
It's very narrow bandwidth, but that's not a problem with your requirements. Since there was only one pair of plates, I build my own butterfly capacitor. Note the voltage across the capacitor.

Geoff, have you considered fabricating a j-pole from solid copper wire?
Yes, it's probably too flexible to be self-supporting from the bottom, as
would a copper-pipe j-pole, but if attached to something rigid, like a strip
of hard plastic, it might work for you.

No, I had not. Thanks for the suggestion, it would work.

Geoff.

There is two TNC's on the floor - in a box.
That is probably the best place for them.
As long as people thinks that the only reason for APRS is to play
Where's Waldo - there is no use putting up the antenna and turning it
on.

It looks to me like I hurt some of the forum retards feelings.
I guess there is more then one person on this forum - who's only
transceiver is a walkie talkie or that uses echo link to get their radio

fix - because they are too cheap or too poor to go out and buy a real
radio.

A forum name can be what ever you want.
I could post my call sign - but that wouldn't prove who I am - just that
I am a licensed amateur.
Even that does not tell the whole story - since I have been around this
longer then what most people who calls themselves old hams has been.

The purpose of most nets is to reserve a certain frequency at a certain
time so retards who are mindless and cannot make a QSO or take traffic
can get on the air and say their call sign and no traffic and feel like
real hams.

Most of them goes into panic mode when you try to pass traffic.
Even the PA 80 meter phone and traffic net is mostly made up of people
like that.
So the only thing we can do is wait and see if these people will someday
die off and the net die's due to a lack of participation and we get rid
of many of these useless / unnecessary nets.

   What kind of coax has 10 dB loss per 50 feet, and at what frequency?
Those RS amps have no equalization, so the low channels would overlaod
the front end, and the high channels would still be snowy if you need
more than one or two..

"Tesla coil circuits were used commercially in sparkgap radio transmitters for wireless telegraphy until the 1920s,[1"
From: http://en.wikipedia.org/wiki/DRSSTC

But in 1929 was wrote: "It is not generally appreciated that this curious apparatus, often associated with pretty or spectacular demonstrations of high voltage electricity, is really a fundamental part of modern radio. For all the tuning apparatus and circuits in every transmitting and receiving set are simply variations of Tesla coils and Tesla coil circuits".
From: http://www.tfcbooks.com/tesla/1929-09-22.htm

Now is 2012. Is " this curious apparatus" the "fundamental part of modern radio"? Of course in form of the " variations of Tesla coils and Tesla coil circuits".

On the other hand, did anyone else notice that Tesla Motors Inc, makes an
Edison designed car? :-)

Geoff.

Here is a paper that will help explain the similarities:

http://hamwaves.com/antennas/inductance/corum.pdf

In Figure 2, the diagram of the Tesla coil looks identical to a 75m
mobile antenna with top hat.

So in your transmitters are the coils made of wires?
Where can I find the scheme of a simple todays transmitter with the coils?

I have found this: http://ham-resources.blogspot.com/2011_03_01_archive.html
There is the scheme with the coils.
"L1: L2:
(primary/collector windings) (secondary/antenna windings)
160m--60 turns, tapped at 20 160m-- 8 turns
 80m--45 turns, tapped at 15 80m---6 turns"

Does it means that the Tesla coils are in all modern ham transmitters?

No, you babbling moron.

A Tesla coil specifically refers to a resonant transformer specifically designed to produce high voltages, typically much higher than 10,000 volts.

The coils in radio transmitters and receivers are part of resonant circuits specifically designed to provide either bandwidth limiting or impedance matching or sometimes both.

I think Jeff - what the problem is, is that the VEC hands out Ham Radio
Licenses like purple Quaalude's at a Grateful Dead Concert.

When your only goal is to increase the number of licensed amateurs, with no concern as to the education portion of the hobby, you end up with a pool of known nothing amateurs, who's only radio set up consists of a single or multiple single or dual band walkie talkies.

Even the local REACT chapter has more money invested in their cb radios and antenna's then the actual amateur radio - Technician Class license holder today.

The burden of proof is the fact that Amateur Radio Clubs in my area are being operated by people who have had their license for less then 5 years, and by people who has no actual real knowledge of how their radio actually works.

The Technology aspect of the club environment has been changed by coffee and doughnuts.   " I pity the fool that gets between those club members and the coffee pot when the meeting is over!"

Because of that, most people feels that it is not necessary to join any club, or find a Elmer once you get a license.   The people who holds a license isn't qualified to be a Elmer anyways. So basically these people are free to wander the earth, hopelessly lost. Not knowing what purpose Amateur Radio really serves. The ARRL, in hopes of attracting new members, says that the purpose of Amateur Radio is to do Ecom... ONLY Ecom requires training and participation and the use of more then just a simple walkie talkie.

When all else fails - amateur radio still works. - YES
But when all else fails - if your radio equipment does not work - you go hungry, Bow Wow Wow!

People sees something or they read something or they are spoon fed from the QST Magazine they get every month from their membership from the ARRL and they see the articles in the magazine, but the magazines real purpose is to sell stuff.   The advertisers is what keeps the magazine going.
I say it over and over again. They are not going to say anything bad about amplifiers - because the first ad you usually see is for some type of amplifier.

People are like Tim the Toolman Taylor - More Power arugh arugh arugh!
Only there is no one around willing to stand up on the soap box and tell them that if you have a 100 watt transceiver, to move the S meter one S unit between S - 1 and S-8, you need to increase the power 4 times / hence you need 400 watts just to move the S meter one S unit.
All signals reduce at the square of the distance away!
1200 watts is only 2 S units.
Yet everyone thinks that with a 1500 watt amplifier, you are going to set the world on fire...
That's only one S Unit - if you were 10/S-9, or two S units if you were less then S-7 with 100 watts...

The stuff that Tesla was doing, would have burned the hair off your head

while you stood there and looked at it.
He was able to send electricity through the air for something like 26 miles.
The reason why we don't use Tesla's model of electric transmission is due to the fact that if we did. all we would have to do is stick a antenna up in the air and receive electricity.   They wouldn't even have to meter it, because it would be so cheap. The problem is - trying to get these cheap skates to pay for it.

Now think back - gee, stick a antenna in the air and receive free electricity.
Isn't that what we are doing with Amateur Radio?
Or antenna is a electrostatically charged device.
We create power when we transmit and we receive power when we receive someone else's signal..
Maybe what Tesla didn't understand was Broadcasting!
Maybe that was the reason why his coil was dismantled at the start of WW II - because the government knew that if it fell into enemy hands, it could be used to transmit anytime, day or night, globally - any information that someone wanted to send.

Even the largest transmitters of the time - such as WLW's Big Arse Transmitter couldn't compete with the one Tesla built....

The first person to NOTICE that resonance exists in a capacitor and inductor circuit, thus forming a tuned circuit, was Felix Savary in 1826.

The first patent for a spark-gap transmitter and a receiver with tuned circuits in them was filed by Oliver Lodge in 1897.

Marconi tried to sell his communication system to the US army.
They refused to accept because the system would receive
from all ships simultaneously without selection.
Then he added selective tuneable circuits.

Tesla on the contrary polluted the whole radio band with his
broadband lightning towers and poked fun at those "Hertzian waves".
Tesla never understood and went bancrupt for senile stubborness.

I'm not sure where all this is heading, but always keep in mind that
there is no free lunch, and at certain locations, lunch is very
overpriced for what you actually get for your money.

I was looking at an engraving of an early ham shack. One thing about these old-time images that has always piqued my interest is the antenna- usually 4-5 parallel wires evenly spaced above the roof.

What type of antenna is it? End-fed or mid-feed making it a type of dipole? You don't see them any more, so they must not work too well, right?

Anyone have anything to offer?

I believe it is called a flat top antenna. I've seen them in old pictures of Navy ships, strung between masts and/or stacks. A bit of research seems to indicate they could either be center-fed as dipoles or end fed as inverted-L's. (If center-fed, I don't know why it wouldn't just be a fan dipole.)

My experience with Navy antennas is fairly extensive and I never saw one on any ship, so apparently they gave way to the fan-wire antenna. The fan wire, or just fan, is hung vertically or almost so, fed from the top, electrically less than a quarter-wave, and consists of multiple strands to aid in the broadbanding effects. All the fan wire antennas I ever saw were fed through a matching network to keep the SWR under 3:1 across the band of interest. The matching network box usually contained a Tee or Pi network.

Done. I hope it helps.

Just moved into a Senior's Lodge and am waiting for some new
gear I purchased to arrive.  I'll be QRP but was always a QRP advocate
and seldom ran more than a few watts.  It's going to be tricky here and
I will have to use all my experience and expertise to get some form of
invisible or very low profile antenna out of my window which has
a small opening.  I should have everything ready to go in a month or so.

I spent a few years on pre-war Frigates and used flat-tops a lot. I never did
any technical comparisons but we always managed to get our communications
through. I am a firm believer in the idea that any piece of metal that can be
loaded will get a signal out, but it's kind of like firing an arrow into the air
and not being sure where it will land. Usually if you could hear a signal from
the area you wanted to send to, you could get through to them.
Likewise, if you can hear a ham reasonably well, chances are that
you will be able to work him.

David Quest;788733 Wrote:
> It's alive and well......Spread the word

The problem is not if it is alive or dead, it is the quality of people involved with amateur radio today.

I see a couple of different types of people.
The leaders
The followers
The Sheep
The dumb asses with the walkie talkies, cell phones, voip - computer - that doesn't want to do Ham Radio - they want to do Cell Phone and Computer radio.

Then you have the old guys - who have done it all and doesn't want to help anyone - is too old to buy anything new, spends most of their time tuning up over other peoples QSO's and only talks on nets.

Then you have the old hams - the guys that were licensed as teen agers, realizes that the old hams are going to die or retire. That thinks that the world owes them something. Wants to be the section manager or regional manager of the ARRL. The low life scum that thinks that it is political.
Who gets the sheep to blindly follow them, gets the followers to follow them - with the promise that they will help them someday - maybe.
Assumes the role of leaders at their local clubs - but doesn't really do much of anything.
For the most part - you have a lot of clubs where the President makes all the rules and demands that everyone else just blindly follow them.
The followers thinks that belonging to a club will automatically make them ham radio operators - yet the President and the officers don't actually teach anything, doesn't actually Elmer anyone and their only goal is to use the club as a stepping stone - get the votes to become the section manager etc and then the people who helped get them to where they are at - are forgotten.

Just look at the officers of the ARRL and see where they came from, and their age, and the people who are lining up to take their jobs.

Then you have the Vultures.
You know who you are!
The ones that circles a mans house when he is dead or dying.
Looking to steal all of his / her ham radio equipment when they die.
Probably the main reason why there are so few hams who becomes Generals.

Once people gets their Technician Class License, finds out how much new radios cost, can't afford a used radio - even if it is available and just drops out after a couple of months or years - because there is no incentive to advance.

The clubs preaches public service and ECOM - but doesn't really do much of anything about it.
Most people cannot take traffic and are unwilling to even talk on the radio.
They are of no use to anyone in a emergency - unless the only traffic you want to pass is their call sign and No Traffic - because that is all that they have said on the local nets all of their ham radio careers.

Picked this up from an old newsgroup post.

....

Flat-top arrays were used for low frequencies where the useful radiation was from the vertical portion of the antenna. The simplest flat-top is a T-antenna. They were used instead of an inverted L-antenna as the radiation from the horizontal portion of the antenna was cancelled by the symmetry of the two horizontal sections. In essence, the flat-top portion of the antenna was a "capacity hat" in modern parlance. The more the number of horizontal wires, the more capacitance, and the more the antenna efficiency was increased (although it was still extremely small). Better efficiency was obtained by arranging the horizontal wires in a conical or cylindrical fashion as in a truly flat flat-top, the antenna current tends to concentrate in the outer wires.

Probably the best information about these low frequency antennas can be found in "Radio Antenna Engineering" by Edmund Laport. I believe a copy is now posted online. To illustrate a flat-top design, I will post a drawing to the alt.binaries.pictures.radio Usenet newsgroup. Since the "alt" groups are not carried by news.eternal-september.org, I will have to post using nntp.charter.net which frequently does not work.

73, Dr. Barry L. Ornitz wa4vzqNO
....

Here's a link to a download of "Radio Antenna Engineering" by Edmund Laport. It has been reported to have lots of info an low frequency antennas.

Mikek

In the sixties we had offshore medium wave "pirate radio" ships, and one of them had an antenna like that. I once tried to get details about how this antenna was supposed to work, but never got a reply.

The ship initially transmitted in the high end of the band, and the antenna looked like 5 wires spaced about a metre apart between the two masts of the coaster, with a vertical wire in the middle connecting to all 5 wires in parallel and leading down to a tuning unit in a small housing on the deck. My theory is that it indeed was a vertical radiator with a capacitive top hat. The height was only about 20 metres, so the vertical was maybe 1/8 wavelength.

Later, the station went QSY to the lower end of the (medium wave) band, and the antenna had to be changed. It must have been a big technical challenge, to construct an antenna that small for a medium wave transmitter at 556 kHz.   What I have been able to find about it describes the antenna (which still looked the same) as a vertical that ran to the top hat, which now no longer was 5 parallel wires but a single wire that ran zig-zag between the endpoints.   So, 4 times forward and backward between the ends (about 20 metres apart) and then to the middle and down to the tuning unit.

How that did ever work reasonably is beyond me.

It does indeed, and it does discuss flat-top LF antennas in some
detail (they're basically capacitively-loaded verticals, as stated).

http://snulbug.mtview.ca.us/books/RadioAntennaEngineering/ will get
you to several download links.

I recognize some of the characterizations you cite but they are uncommon.
You aver that they're all you know. Your post was so negative! I have a
hard time grasping why you've stayed in the hobby. If you have anything
upbeat to post, I'll read it.

That's four types, not a couple.. Although I suppose there is some
redundancy involved. IE: many dumbasses are sheep, many sheep are
followers, and most followers tend to follow the leader. :/

>
> Then you have the old guys - who have done it all and doesn't want to

Maybe they are tired. And they probably already own everything they
need, and thus have no need to buy more stuff. As far as the tuning
and netting, I would consider that a personal problem..

>
> Then you have the old hams - the guys that were licensed as teen agers,

I've been a radio buoy since I was a teen. So I guess I sort of fit
this category. And I do realize that everyone retires, and then dies,
sooner or later. This is another personal problem that all must deal
with sooner or later. Novice through Extra.. All are gonna be worm

food some day.. Death is not picky, and death took the 20 wpm
code test, so even CW ops don't get a pass on death. :|

Thinks the world owes me something? What would that be?
As far as I know, no one owes me anything, and as far as myself,
I owe very little.. :/

But, if the world owes me something like you say, I'll take an old Ford
GT-40. I'm not too picky about the color.

Want to be section manager or regional manager of the ARRL?
Are you kidding me? You couldn't pay me enough to involve myself
with such silliness..

> Who gets the sheep to blindly follow them, gets the followers to follow
> them - with the promise that they will help them someday - maybe.

I don't want anyone to follow me..

> Assumes the role of leaders at their local clubs - but doesn't really do

I don't do clubs..

>
> Just look at the officers of the ARRL and see where they came from, and
> their age, and the people who are lining up to take their jobs.

Why would I waste my time? I could care less about the officers of
the ARRL, and I could care less where they came from.
And if someone wants their jobs, how long is this line?
Are they as long as the lines that form outside of shopping malls
when a new brand of sneaker comes out?

>
>
> Then you have the Vultures.

I've never seen a bird get a ham license... I guess they can
pass it now that they did away with the code tests.. :|

> You know who you are!

Yes, I know who I am. :/

> The ones that circles a mans house when he is dead or dying.
> Looking to steal all of his / her ham radio equipment when they die.

Radios, radios, and more radios!!!! Yee-haw!!!!

> Probably the main reason why there are so few hams who becomes
> Generals.

Maybe so. After all, why would one upgrade to a higher license,
if one has to constantly worry about some vulture flying over and
dropping a vulture turd or two on their heads... :|
They practice this you know.. It's kind of like learning to drop
fire fighting mud and chemicals on forest fires, except on a smaller
scale.

>
> Once people gets their Technician Class License, finds out how much new

Life's a bitch, and then some people make the mistake of
marrying one.. :/
But realistically, it sounds like they need a better job, more
than they need a ham license.

I have loads of radios.. So many, I can't even keep track of
them all. Big radios, little radios, and many radios in between.
I think they secretly breed when I'm away, and spawn more little
radios and radioettes..

>
> The clubs preaches public service and ECOM - but doesn't really do much

Well, why don't you teach them then..
BTW, myself, I can handle traffic. I'm ex-MARS, where they actually
do run a bit of traffic from time to time..
But very few people rely on amateur radio to pass traffic these days.

So even though I can handle traffic, I rarely have the chance to show off such advanced radio skillery. :/

> They are of no use to anyone in a emergency - unless the only traffic
> you want to pass is their call sign and No Traffic - because that is all
> that they have said on the local nets all of their ham radio careers.

I'm of total use in an emergency. I can do anything anyone might want to do, and I can do it from any location on the planet.

But, I rarely do nets.. Too boring for my blood.

My idea of ham radio is sitting out in the middle of the woods, sucking down a few cold ones, kicking back, and talking to all them good ole buoys on the radio.

No one ever follows me. My woods are so secluded, no one would ever find me even if they tried.
I do see some vultures from time to time, but then again, I see a lot of birds out in the woods.

Worrying about nets, managers, clubs, and vultures is no way to go through amateur radio. Sounds pretty danged boring too..

I watched this and some of his other vidios a week or so back.

I have learned more from him than I got from any other books I have read.. Seems that all the other books were wrong. I had a First Class Phone license almost 40 years ago and an Associate degree in Electronics Engineering.

I need to ge back to school and see what has changed. Maybe he is using the new math to calculate the SWR.
Must be government matn.

What were the references to "the three-field" and "the five field" or maybe
"the far field"? Did anybody make that out? (Started around the 1:45 mark.)

He does say "a lot of CB'ers" once, which identifies him, I think.

Looking at portable and easy to deploy method of putting up a 5/8 omni directional antenna for CB/10-11m trans/rec. Is hooking up an antenna wire to a helium balloon on the "top" end and connecting it to coax at the "bottom" a possible option? Obviously there are many environmental limitations with the concept, and it is a strictly single use application. But for camping or emergency back up use, the concept sounds at least plausible. Anyone have any technical reasons why this is not feasible? Better yet, anyone have any experience with anything similar?

If you include operation in the rain then the balloon needs to be attached to a low-voltage point on the antenna - certainly not the end of a dipole element because a wet string leading to a wet balloon would likely detune it. Some people I used to know used discones in this application, and the centre of the disc is a relatively low-voltage/low-impedance part of the antenna. The technique was used extensively in planning the UHF transmitter network for television broadcasting in the UK, before computer modelling and simulation was allowed to take over with remarkably little proof of its accuracy!

Chris

I would not use a 5/8 antenna, as this requires 1/4 lambda radials,
and has (virtually) no advantage over a half wave. A half wave wire
end-fed antenna design can be used without radials mostly.

If you use grease impregnated wire, or monofilament line to tie the
antenna to the balloon, it will not reduce efficiency, even under wet
conditions. Of course you could also use a plastic insulator. you may
know raising the antenna will enhance ground wave propagation, but
above a certain height will not improve ionospheric propagation.

Why not use a fiberglass mast?

Nope. A "pill" is a ceramic case RF power transistor that looks like
a large pill.
<http://www.cbslang.com/dictionary/pills>

Hi

Anyone familiar with the Energiser CHDC-CA Battery Charger? That just happens to be the model number of the one I have but very common all over the place and just the typical AAA and AA battery charger. Charges 4 at a time. It is timer operated meaning it operates for about 8.5 hours and shuts off preventing over charging. The manual says it will charge 2650mah AA batteries in 8.8 hours then shuts off automatically. I try to deplete the batter as much as possible. The unit's output is 2.8v 360mh . Now I believe also its max charge time is 8.5 hours or auto shuts off at 8.5 hours. Now, my new batteries ni mh are 3000 mah . Now if you cross mulitply you end up with a 10 hour charge time mathematically, that can be done, just charge 1.2 (or 1.5) hours longer and remember to stop it. But if you factor it differently as the 3000mah divided by the 360 equals the 8.3 hours to charge, not needing the additional charging.

Anyone have experience with these? Just typical rechargable batteries for camera. Any tips on charging these properly?

Thnx 73s

I can contribute only a little: Ni-MH batteries and Ni-Cd batteries are different as to how they take a charge. While many Ni-Cd's no longer display a memory effect, some do. As far as I know, there's no memory effect for Ni-MH. This means you need to treat each type differently.

Would I be out of line to ask you what kind of battery you use and then narrow the discussion to that type?

Hi Sal

I bought the ones off ebay that came from hong kong in about two weeks.
Package of 24 aa batteries and aaa batteries. These are nickle metal
hidryde. There shouldn't be a memory like the cadnium ones. These are the
3000 mah batteries and just wondering about charging them with my older
battery charger that only explaines about the 2650, so I don't believe my
batteries are charging to full capacity. Not even close.

It's a T antenna (top loaded vertical)

Topband_160m_T_Antenna1.jpg

The top wires are a capacity hat. The vertical wire does the radiating.

I have called almost every Henry's and the Energiser's tech line.

Now Energiser cannot advise anything, they only sell batteries up to 2500mah
and chargers to same. Now I imagine soon they will be selling 3000mah

batteries as Panasonic and so many other mfgs do already. The batter charger I have is obsolete now, 2 years old and actually they still sell it at Henrys.

So I suppose my options are to buy a battery charger that is smart charger that measures through trickle the capacity of the charging battery and shuts off when trickle gets low enough. Or, use this charger and after its 8.5 hour automatic shut off time to pull out then push back into wall plug to add about 1.5 hours of charge and not forget or it will run the cycle of 8.5 more hours and dissapate heat or overcharge the batteries reducing their life.

The batteries measure 1.38 to 1.39 volts after the 8.5 hour plus the extra about 1.5 hours charge. They measure about 1.17volts when empty.

Whats a poor boy to do? Come on Dave, I know you know. And you know that I know that you know that These are for that battery pack for the HT that I use to measure the gnd radiation for my sauna rocks. Very important.

He's an idiot. He doesn't care that his posts are always off topic, and at least some people doubt he even has a license. He clearly doesn't understand batteries and charging them, nor much of anything else it seems. Just do what most people do - ignore him.

Yes, just call the cable company, tell them you will change to satelite
because it doesn't work.

They will do it for nothing and very quickly.

>Anyone familiar with the Energiser CHDC-CA Battery Charger?

Yep. I have one. Piece of junk. Works only with NiMH. It will kill a NiCd battery and will overcharge a partly charged battery.
<http://data.energizer.com/PDFs/chdc.pdf>
"Best used with Energizer NiMH batteries."
Note that it's obsolete.

>Now, my new batteries ni mh are 3000 mah.

Maybe, under ideal conditions and with a very small load. Otherwise, I've never seen a 3000ma-hr battery.

I have a West Mtn Radio CBA-II battery analyzer:
<http://www.westmountainradio.com/product_info.php?products_id=cba3&navcode=/cbaLink1>
I've tested a few of the flea market NiMH batteries claiming to be 3000ma-hr and found them lacking. I'll post the graphs (if I can find them).

Incidentally, did you know that it requires one or two initial charge cycles to get an NiMH battery up to full capacity? I didn't believe it so I ran some tests:
<http://802.11junk.com/jeffl/NiMH/>
It's not much, but it's certainly real. Note that the load was on the high side at 1C resulting in measured battery capacity lower than claimed. This is normal, but I was in a hurry.

>Anyone have experience with these? Just typical rechargable batteries for
>camera. Any tips on charging these properly?

If it's only run by a timer, it's a piece of junk. It probably assumes that the batteries to be charged are totally discharged, and after 8.5 hrs of charging, will be fully charged. That sucks because a half charged battery will be overcharged by that method. If the batteries get warm, they're being overcharged.

What it should do is look for a decrease in terminal voltage, indicating EOC (end of charge).
<http://en.wikipedia.org/wiki/Nickel%E2%80%93metal_hydride_battery#.CE.94V_charging_method>

More:
<http://batteryuniversity.com/learn/article/charging_nickel_metal_hydride>

Now, can be get back to antennas?

Full disclosure:  I got my start in radio in about 1965 with an EICO
model something CB radio.  Ham radio was available, but I was too lazy
to study for the license.  CB was also cheaper and easier.  Many years
later, I worked for several companies that manufactured or sold CB
radios in addition to their commercial radio products.  I also
designed a CB paging system (that was never produced).  When I owned
```

part of a land mobile radio shop, we also sold and serviced CB radios.
It's really difficult to work in commercial radio, and also avoid CB.
I don't see how you've made it this far, and missed all the CB
history.

While much of the CB lingo is fairly new and amazingly creative, some
of it is based on ham radio lingo, which is not so new or as creative.
Somehow, I think we missed a splendid opportunity to add our mark on
technical slang.

Hi Jeff, Thanks for the info. That pdf is where I learned that this charger only runs for 8.5 hours and it recommends stopping at certain times for certain mah batteries. It works nice for me because I can plug it into 120 or 220 where ever I am. And my batteries are always depleted before I charge them.
Only problem is that I bought the battery pack for my ht and it takes 10 but charger only charges 4.

http://www.ebay.com/itm/160593039544?ssPageName=STRK:MEWNX:IT&_trksid=p3984.m1497.l2649

But the batteries I bought were these ones

http://www.ebay.com/itm/New-Camera-Rechargeable-Battery-8pcs-AA-3000mAh-NiMH-F1-/330538074900?pt=US_Batteries&hash=item4cf59ac314

I have bought these batteries before for my home phones and they work great. The home phones batteries lasts for weeks without putting back on the charger. I guess I am used to the ni cads because I like to deplete 100%, just a habit.

But that charger pumps out 360 ma at 2.8v and if I do the math that tells me they charge completely at 8.3 hours. That falls within the operating range of the charger. Why does the instructions say 8.5 hours for the 2650 mah battery for full charge? Is the charger that innefficient that there is 20% loss? Or were the first couple charges not effective like you said. This is the third charge and the HT emptied quickly. Plus I am now pulling the charger and plugging in again only for about 1.5 hours. Would you recommend that?

Since it is for my HT I would only assume it qualifies for antenna subject,

I am surprised that absolutely none of the dozen local electronic stores and box stores had any idea what I was talking about, even the energizer tech support line were scratching their heads, yet seems so logical a question for me because I want those battery lives to last as long as possible and charging is the answer there. Hense my original question about the charger.

These batteries measure all 1.38 volts when charged pretty consistantly and 1.17v when depleted, other than that I cannot measure the efficiency of the charger to predict time of charge, according to the manufacture it should be 9.9 hours, according to the math 3000mha devided by 360 ma of the unit says 8.3 hours to charge full capacity.

Which is it?

73s

How about this story:

A mad scientist invented the Ultimate Brain Machine. At the press of a button, he could aim a ray at somebody's head and change their IQ.

First, he tested it on a plumber. He pressed "UP," waited a few seconds and pressed "STOP." The plumber started quoting Shakespeare and explained relativity in simple terms.

Next , he tested it on an electrical engineering professor, who was also an Extra Class ham. He pressed the "DOWN" button and waited a few moments. Just then, the phone rang. It was a call from his nasty, old wife and he got into a shouting match with her.

When he hung up, he raced over to the machine, now overheated and smoking. He pressed "STOP and asked the professor if he was all right.

The professor replied, "That's a big 10-4, good buddy!"

I think I've heard most of it, I just hadn't heard "pill". The short
time I was into the CB craze it was in a pretty rural part of northern
NY, so maybe that term hadn't made it there.

tom

Ok
So one calles me an idiot, another calls me brainless.

One chap partially answers my question, thank you very much.

What happened to Hams? Used to be such a knowledgeable bunch, still are however there are lots who are wanna bees and you can patrol the newsgroups looking for whatever.

I have a pretty good question here Mark, Robby, just because you don't know the answer, don't make it look like you are smarter than me.

So Robby, you called me an idiot, yet I asked the question, and you haven't any idea about the question. Same to you Mark. Just because you don't know about rechargeable AA batteries, keep your ignorance to yourselves. I am asking, and just because you don't know a thing about AA batteries, well, I recommend either you asking or take a course.

The best thing for you two to do is when someone asks a question, and you don't know the answer, haven't even a clue. Just hang on the side there and watch (or listen) and you will learn also.

I think I may have answered it myself anyway, I am charging for a full charge then about 15% more which re-sets the timer. And I also agree with Jeff, the first few charges in their genisis are important.

So there you go Mark and Robby, see you learned something here today, you can thank me. Why not thank someone who helps you learn, instead you call them names, fling some mud.

Good luck

73s

Hi guys

I think i have answered my own question again. Jeff you are right, the charger I have is lower end and while good for traveling, it is lmited.

The older chargers aren't suitable for the newer batteries. With 3000 and 3500 mah batteries out now and these older chargers are only good for lower amp hour batteries, you need the smart chargers. Here is one I am going to try and will give you all a report later on as to its workability.

http://www.thomasdistributing.com/Accupower-AccuEvolution-Smart-12-Slot-AAAAA-NiMHNiCd-LCD-Fast-Charger_p_3012.html

If anyone has comments on this charger, I sure would like to hear. Seems like it is a good smart charger but only runs up to 2900 mah so my batteries that are 3000 mah may work well.

I didn't say it was limited.  I said it was a piece of junk.  I have
mine in my digital camera bag, for use only in emergencies.
```

My favorite cheap NiMH AA charger is another piece of junk that I picked up at Radio Shock. Model 23-1305.
<http://www.digicircle.com/item_desc.php?make=RadioShack&model=23-1305%2030-Minute%20Battery%20Charger&id=29506745>
Works with AA NiMH only, charges in 30 mins, and hasn't killed any cells, yet. It's smart enough to recognize that a cell is partly or fully charged. I erratically retest my NiMH batteries for capacity loss after charging with my CMA-II battery analyzer. No problems yet.

If you want to do something better, try converting your HT battery pack to Li-Ion. You'll need an external Li-Ion charger and some mechanical work, but the resultant huge increase in capacity will be worthwhile. I've done this for a few home toys (flashlights, alarm system, battery backup, etc) but have not tried it with an HT. See model airplane and model auto sites for chargers.

If not, go shopping for an NiMH "smart" charger.

> the unit says 8.3 hours to charge full capacity.

Math always works but it won't give you a good answer if you use bad
numbers.

Here's what I mean: Yes, 360 mA times 8.3 hours equals approximately 3000
mAh but you have overlooked a widely-acknowledged rule for recharging:

Charge at 0.1C for about 16 hours, where "C" is the nominal capacity. Using
that rule, you charge a 3000 mA-h cell at 300 mA for 16 hours. (A battery
maker may impose or recommend something else. I'm parroting what I have
picked up.)

Not all the energy is stored by chemical conversion. Some is lost as heat,
which explains why you need to run the charger longer than you calculated.
(9.9 hours gets you closer but I bet they want to stop short of a maximum
charge to avoid having the cells vent.)

Some support for my views, plus helpful advice here:
http://www.powerstream.com/NiMH.htm

If someone wants to answer an off topic post, that's is up to them, I, and several others don't encourage them by refusing to answer. Your logic(?) is flawed if you think owning an HT that has an antenna means your battery questions are relevant - they are not. That same logic would give you or anyone else the right to ask about an automobile engine simply because the car has an antenna, be it 10, 6 or 2 meter, it doesn't make it on topic. Only an idiot wouldn't understand that.

>What happened to Hams? Used to be such a knowledgeable bunch, still are
>however there are lots who are wanna bees and you can patrol the newsgroups
>looking for whatever.

When you become one, be sure to LEARN about the basics, or at least learn where to go to be on topic. A good general information place to start would be alt.ham.radio but be forewarned, don't ask about your sauna rocks, or any other non-amateur radio related subject, it will only give you away as an idiot or troll. Your "handle" seems appropriate at least. If you are going to insist you are a licensed ham, prove it first. You have certainly provided enough information to prove you aren't. One more time, if your question doesn't relate to the title of the group, don't bother asking there, go to any group that is simply a ham radio group, not an antenna group, not a digital group, nor any other group your question directly relates to, not because you happen to have an antenna in the next room, or a modem packed away in a box somewhere.

>I have a pretty good question here Mark, Robby, just because you don't know
>the answer, don't make it look like you are smarter than me.

Your attempt to egg us on, well, I can only speak for myself at least, will not work. I can't speak for Mark, but I will only state that I most assuredly know about this topic, and let me add, your musings are so far off base, they have been entertaining, if nothing else. I, like many, do not encourage repeated abuse by people like yourself. People who, in spite of being told repeatedly that your posts are off topic in this group, continue to IGNORE those who tried to help you by pointing you to one of the other groups where your ignorance will be hidden from view by virtue of not being off topic. If you continue to ignore this fact, then you are rightly labeled as ignorant. I can only surmise you are either a politician, or a salesman of some sort. A car salesman perhaps? Or maybe a tire, (or do you spell it tyre there) jockey? Oh, and I don't have to be ignorant of batteries, (I am quite knowledgeable in fact) to make it look like I'm smarter than you are, you are proving that just fine all by yourself thank you. You would have been much better off not responding to my post.

>So Robby, you called me an idiot, yet I asked the question, and you haven't
>any idea about the question. Same to you Mark. Just because you don't know
>about rechargeable AA batteries, keep your ignorance to yourselves. I am
>asking, and just because you don't know a thing about AA batteries, well, I
>recommend either you asking or take a course.

Again, your crude attempt to provoke an answer out of me at least won't work.

I'll leave it to Mark to give you his response, if he even bothers to give you one.

Speaking of responses, this will be my last, regardless of how much you try to provoke one. I can only speak for myself, but I would hope everyone else here ignores your future off topic posts, as amusing as they might be, they have no place here. If you feel this is unfair, comment about it in alt.ham.radio, or better yet, find a Canadian amateur radio group, perhaps they will have more lax rules.

Come on now Mark Play Nice.

You can't fix stupid!

Handitalkies are for idiots.
WHY?
Because they don't do anything!
Yes they are great for public service events, for hamfests where you want to keep track of each individual person in your group, in emergencies where most communications has been wiped out.

But they suck if you cannot hit the repeaters and their LOS is determined by the size of the ANTENNA, and the height of the antenna above ground.

Two rules of thumb - transmitter range is usually LOS - Line of Sight, even when it is line of sight, the range even for a good antenna is about 1.15 miles per each foot the antenna is held above ground.

Rule number 2 - most educated people, builds repeaters in high places. Mountain tops, tall buildings, on top of tall towers etc....
The repeater by rule of thumb - usually has a hi gain antenna and a transmitter of 10 - 150 watts..

This extends the range of the hand held as well as the repeater.

The funny thing is - most people are so uneducated - they do not realize that the repeater does all of the work.
All that they are concerned with is that they can buy some type of handitalkie for $50 - $250.00 and are free of the expense of a radio, a power supply, a length of coax, a tower or piece of pipe, grounding, a hi gain antenna - which all costs money!

If the only radio a person owns is a handitalkie - they are not HAMS - they are CB;rs....
Why?
Because when MR. Tornado comes to town and wipes out the repeater - they are of no use to anyone except the local group which handles traffic from the EOC to the hospital, Police, Fire, Ambulance - locally.

Most of those people - because they have no radio experience, is dumbfounded when it comes to putting up temporary repeaters, handling traffic, being of any real value. Because the Handitalkie pretty much reminds them of being on a phone - they end up talking most times as if they were on a telephone. That in return makes us all look bad!

Most times when a emergency does happen, the walkie talkie is still sitting in the drawer - where it was kept for emergencies -with dead batteries and of no use to anyone.

At least the OP didn't waste their money on one of these new Bofung handheld $50.00 radios. Their battery lifespan while transmitting is about 45 minutes max.   What does a person do after a hour and a half when both the battery and the spare is dead?   They run back to the EOC for another radio or another task to perform.

My personal opinion is that if a person had a GOTA bag with a 50 watt mobile transceiver, a dual band antenna, 6 sticks of 4' fiberglass pole, a ground rod, a 40' length of coax and one of those 850 CCA jump starter battery packs - they could effectively reduce transmit power if needed and could transmit for hours on a single charge. It could be recharged off a vehicle battery, and if it had cross repeat / could be used as a repeater in a emergency to go between the walkie talkies and a more distant repeater...

Hi, it's me again.  Does anyone know of a good reliable RF amplifier for the
433 MHz range?  We need a gain of roughly 20 dB.  We want to use it to amplify
our received signal from the beacon.  Thanks in advance for any help.

PS  We realized the thing about rotating the mesh was not an issue.  Thanks
for the replies to that Paul and Helmut.

depends where you are situated,
look for something like that
http://tinyurl.com/7bmqw6q
broadband amplifiers, they are cheap and you do the filtering
by making a selective antenna.

Narrowband amplifiers are a little more expensive
http://www.minikits.com.au/eme173.htm

At http://www.dxlabsuite.com/ you will find a suite of programs which
includes DXKeeper.

It will interface with several sources of info such as the QRZ callbook
as well as eQSL and LotW and keeps track of numerous awards.

You can install as many or as few of the applications as you find useful and they integrate with each other.

If you do any PSK or RTTY, WinWarbler is especially nice. It is also handy in SSB mode since it is integrated with DXKeeper.

There are too many features to talk about here; see the web site for details.

FYI if you do not have rig or rotator control from your computer, those things are just ignored.

Cheapest solution would be a television UHF pre amplifier.
The goal being the one with the lowest noise factor and the most gain -
while filtering out anything that would cause overload.

Without a physical address - where I could see what else is in the
neighborhood - there is no way for sure to answer your question.
Anything from Police stations to ambulances to fire stations to GMRS and
Amateur repeaters might create harmonics which could get into your
amplifier and cause overload.

Here is a cheap solution - http://tinyurl.com/7nj9yy6

Anyone remember the 3or4 band antenna, omni that needed to be right on the ground. I think it had 3 traps in it. Might have been for 10, 15 and maybe 40 or 20 meters.

It might have been a crushcraft or alpha. has to be about 30 or 40 year old antenna.

Anyone remember that old antenna? What was its manufacture? Model ?

thanks if anyone can remember.

What elevation tool do you use and how does it compare in accuracy?

I'm trying to do some antenna siting calculations ... and ... for that ... I need elevation information.

However ... given any set of coordinates ... e.g., Mt Hamilton, California at coordinates 37.337408,-121.644073 ... I find the following elevation tools all give DIFFERENT elevations (some are off by more than a hundred feet!)

1. Google Map API yields 1217.061889648438 meters (3992.985 feet)
http://maps.googleapis.com/maps/api/elevation/json?locations=37.337408,-121.644073&sensor=false

2. Geoplaner yields 1217.1 meters (3993 feet)
http://www.geoplaner.com

2. Daftlogic yields 1230.988 meters (4038.676 feet)
http://www.daftlogic.com/sandbox-google-maps-find-altitude.htm

4. Earthtools yields 1210 meters (3969.8 feet)
http://www.earthtools.org

5. Heywhatsthat (SRTM db) yields 1213 meters (3980 feet)
http://www.heywhatsthat.com/profiler-0904.html

Q: Which elevation tool do you use ... & what's the accuracy?

Unless you are dealing with a surveyed peak, I would assume all the elevation data is derived from USGS NEDs (national elevation dataset). For the most part, they are only 1/3 arc second. I'm speculating that some of these programs are reporting data from the NEDs as if they are section of flat areas on the 1/3 arc second grid, while others are interpreting the elevation using a weighting scheme.
> http://seamless.usgs.gov/

Have you considered running SPLAT! ? It uses 1/3 arc second data. It can predict line of sight. Generally I find I do better than the SPLAT! prediction, so if SPLAT! says no, the answer is maybe, but if SPLAT! says yes, you have line of sight. The program has hooks for predicting signal strength, models knife edge diffraction, etc.
> http://www.qsl.net/kd2bd/splat.html

Similar software is
> http://www.cplus.org/rmw/english1.html

For pure line of sight, there is GRASS. However GRASS has a very steep learning curve.

> http://grass.osgeo.org/

What takes maybe 5 minutes on SPAT can take 2 days on GRASS. I don't
know if the results are that much better.

For the bay area, I suspect SPLAT! is fine. I think it's shortcomings
are in areas where there is really rugged terrain that probably isn't
modeled well.

Youre asking wrong questions.
First define a surface with height ZERO as a reference.
There are about 100 different definitions alone for that.
Distance from Earth center, median sea level at Novosibirsk,
or a San Francisco? Water isn't level, it follows gravitation.
And so on.

w.

I'd use the info from another licensee's application, (on the same
tower). With the FCC you also must specify which survey you are using.
All towers over 200'(AIR) have their own entry in a tower database.

Those of you who are using apartment antenna I would love to know of your experience.

Now that satellite dishes are allowed on most apartments, is there a trend to use an MFJ loop antenna?

What are the real results with QRMing satellite dishes?

RFI in apartmements in general?

I am sure that putting a loop where the satellite dishes go would work great.

What power levels are people using in apartments.

I don't think I would want a loop inside due to high voltages.

Look forward to hearing from you all.

73,

Alan
VY2WU

On Sat, 03 Mar 2012 00:10:32 -0800, miso wrote:
> Have you considered running SPLAT!

I just installed the Splat (Surface Path Length And Terrain) RF analysis application (version 1.3.0-1) from the default Ubuntu Software Center.
- http://joysofprogramming.com/install-splat-ubuntu/
- $ sudo apt-get install splat (dpkg -s splat)

It's apparently a command-line tool which needs me to download the database so it may take a while to figure out.

Googling for a "splat!" tutorial, I find it's also a photoshop hack so it's actually hard to figure out how to use it on the fly.

Q: Do you have a working example or two for how to use it from the command line?

[quote]

```
$ splat --help

*** ERROR: No transmitter site(s) specified!

$ splat

          --==[ SPLAT! v1.3.0 Available Options... ]==--

       -t txsite(s).qth (max of 4 with -c, max of 30 with -L)
       -r rxsite.qth
       -c plot coverage of TX(s) with an RX antenna at X feet/meters AGL
       -L plot path loss map of TX based on an RX at X feet/meters AGL
       -s filename(s) of city/site file(s) to import (5 max)
       -b filename(s) of cartographic boundary file(s) to import (5 max)
       -p filename of terrain profile graph to plot
       -e filename of terrain elevation graph to plot
       -h filename of terrain height graph to plot
       -H filename of normalized terrain height graph to plot
       -l filename of path loss graph to plot
       -o filename of topographic map to generate (.ppm)
       -u filename of user-defined terrain file to import
       -d sdf file directory path (overrides path in ~/.splat_path file)
       -m earth radius multiplier
       -n do not plot LOS paths in .ppm maps
       -N do not produce unnecessary site or obstruction reports
       -f frequency for Fresnel zone calculation (MHz)
       -R modify default range for -c or -L (miles/kilometers)
      -db threshold beyond which contours will not be displayed
      -nf do not plot Fresnel zones in height plots
      -fz Fresnel zone clearance percentage (default = 60)
      -gc ground clutter height (feet/meters)
     -ngs display greyscale topography as white in .ppm files
     -erp override ERP in .lrp file (Watts)
     -ano name of alphanumeric output file
     -ani name of alphanumeric input file
     -udt name of user defined terrain input file
     -kml generate Google Earth (.kml) compatible output
     -geo generate an Xastir .geo georeference file (with .ppm output)
     -dbm plot signal power level contours rather than field strength
   -gpsav preserve gnuplot temporary working files after SPLAT! execution
  -metric employ metric rather than imperial units for all user I/O

If that flew by too fast, consider piping the output through 'less':

     splat | less

Type 'man splat', or see the documentation for more details.

This compilation of SPLAT! supports analysis over a region of
8 square degrees of terrain. [/quote]

I like full wave horizontal loops for the low noise receiving, a hiqh Q
transmit antenna on the patio is kind of cool; another type of barbecue.
I'd stick to CW/digimodes and under 100 Watts.

Thanks for the reply

This antenna is about 22 ft long, no gnd planes, I think it has three traps.

The base has the simple regular 2 ubolt connection to the pipe and the 52ohm coax hook up.

This antenna must be 30 years old or more. I have seen them at many a hamfest , was popular around here way back when.

My wondering is the lengths between each trap, it is telescopic aluminum and it is in pieces. Needs all new hose clamps for each tapered slit connection.

I have seen it before online but do you think I can find it now? I thought it was crushcraft or delta antennas. I will find it and post it.. Jeesh, just cant think of it.

Thanks
73s

A good tuner helps.

What about getting your appt on the top floor, then you can squeeze
something up top a dipole or two.

you know there are a lot of computer programs that allow you the use of ham bands online. That is an option.

Any trees around you could rap a wire around? Any grounded towers already on the roof you can shunt feed?

Some nice omni albanders out there very expensive, just get them high as possible. Or go mobile, get one of those vehicles with huge antennas on and drive to the mountain top and do your transmitting there. Lots of possibilities.

SPLAT! isn't a photoshop hack, but you can use gimp (or I suppose photoshop) to hack with the png files it creates. I take the png files and chop them up so they are acceptable to google earth, then make an overlay out of them. Splat can do it, but unless things have changed, it makes a kml file that can be too large for GE to accept. GE wants tiled imagery. I haven't run it in maybe 18 months, so I can't really say much without setting it up again.

I saw a GPS mentioned. I never found GPS elevation to be too accurate. I have a barometer in my GPS. I never used it, so I can't vouch for it's accuracy. But you can enter in the pressure from the airport, or calibrate it to a known reference (known altitude for a position).

One idea would be to check the USGS monuments and find the closest reference.

> http://www.ngs.noaa.gov/cgi-bin/datasheet.prl

Note that sometimes these markers are on private property. Other times they are in the middle of the street! it pays to look at the reference on google earth before trying to use it. My Garmin gps60cs was good to 4ft, basically one lsb.

You could get a nearby reference, call the barometer, then quickly move to your spot before the pressure changes. Or you might get lucky and find there is a marker there already.

Topo maps have lines of constant altitude, usually on 20ft contours. You could interpolate from the map.

If you really need accurate data, just pay for a survey. I would guess something that simple is under a grand. I've paid for land surveys and they are a few grand, but the altitude at one point is pretty simple. Potentially the civil engineering firm might have topo data on file that is not available to the general public. For instance, I paid for a satellite topo to be done on some property. The civil engineering firm has it on file and I'm sure it gets peeked at by other people.

You only have to read as far as:

"This novel radio technique allows the implementation of, in principle, an
infinite number of channels in a given, fixed bandwidth..."
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
to know it is crap, in principle or otherwise.

Yeah, I read further though. It's one of those things where infinite bandwidth requires infinite power, And almost infinite power pretty quickly.

This is a relative of the phase shift idea, where we can make smaller and smaller shifts until we have amazing channel carrying capacity.

Too bad it doesn't work in the real world. Zero Point energy is more likely.

However, in the digital world, they think that Moore's law applies to bandwidth, so there will be grant money to chase this wild goose.

If in the US, I would assume that the LAT/LONG uses either WGS84, NAD27, or NAD83 datums. That reduces the number of available options.

Unfortunately, the USGS is still hanging onto NAD27, while most mapping programs and displays are on WGS84.
<http://www.maptools.com/UsingUTM/mapdatum.html>
In the People's Republic of Santa Cruz, the error is about 20 meters east-west, and about 1 meter north-south. I forgot which way. The problem becomes really bad when trying to locate a mountain top.
20-200 meters of horizontal error can easily move a position from the peak, to somewhere on the slope, resulting in large altitude errors.

SRTM and SRTM2 are another oddity. They were created from the space shuttle, using a radar altimeter. Depending on the whether it's looking at buildings or trees, there's no really good way to determine of the indicated altitude is the top of a 100ft redwood tree, the top of a 10 meter high building, or at ground level.

So, my list of rhetorical questions are:
1. What is the OP trying to accomplish? If for an FCC license HAAT calculation, almost any reasonable guess will suffice.
<http://transition.fcc.gov/mb/audio/bickel/haat_calculator.html>
If for doing Radio-Mobile coverage contours, you'll need to use the built in mapping tool to find the peak or exact location on the mountain top. The choice of application depends on what one is attempting to accomplish.
2. What level of accuracy is really required? The original position of 37.337408N -121.644073W is specified to 1 millionth of a degree, or about 0.09 meters.
<http://www.csgnetwork.com/degreelenllavcalc.html>
It would be interesting to know where this highly accurate number came from. Better GPS receivers, without DGPS, can do 3 meters accuracy.
3. What datum are you using? I suggest WGS84. If the lookup tool offers a choice of datums, pick one and stay with it.
4. Are you interested in ground level, building rooftop level, or tree top level?

I guess they don't care where the dish focus is located or disclosing
how the antenna or receiver seperated the two signals, each with a
different "spin".

The Register summary is a muddle of buzzwords.  The original article
is more detailed and enlightening.

It seems you make the mistake of equating a "channel" in terms of
communication theory to a slice of bandwidth on RF. Those are
clearly not the same thing.

One can use the same RF bandwidth slice as a channel multiple times,
and thus transfer many times the amount of information such a communication
channel can theoretically carry.

Examples:

- horizontal and vertical polarisation of EM waves

- beam antennas beaming in different directions

- pairs of sending/receiving antennas that are shielded from eachother
  e.g. by the curvature of the earth

Of course, the Shannon theory considers all those different instances a different channel, each of which can carry a certain amount of information.

But as the user/licensee of a slice of spectrum, it is tempting to call that slice of spectrum a channel and welcome any way of transferring more information through it that was thought possible before.

And this seems to be what is going on here.

Of course, practical limitations on separation will make it impossible to realize a large gain from this, let alone "an infinite number". But that is just the journalists ignorance part of it.

I had a nice cw qso with a fellow in an apartment using a 9:1 unun made by balundesigns.com to a straight wire off his apartment balcony to a tree. Such a wire could be made very small and almost invisible, if that is a possiblity. Also, easy enough to homebrew your own 9:1 balun for such, if you are inclined.

If you could feed with parallel line, an end-fed zepp might work well, but would require an end support, such as a tree, and the parallel is more visible.

If the second support is not practical, many have used coil loaded verticals off a patio. This could be done with a collapsing fiber glass pole for removal when not in use.

Both schemes would require a tuner.

>GPS < 3 meter error

Yep. However, standing under the tower, in order to take advantage of this level of accuracy is often impractical. Climbing barbed wire topped chain link fences is not my idea of fun. I ran into the problem when I was throwing together a map of the local cell sites:
<http://802.11junk.com/cellular/>   (from about 2002).
I had a suitable GPS, but I couldn't get anywhere near some of the towers in order to get an accurate position. I had to record a GPS location nearby, measure or estimate the distance and direction to the tower, and then do the math.

I forgot to mumble something about HARN and NAVD88, if the best possible vertical accuracy is required:
<http://www.ngs.noaa.gov/faq.shtml>

Also, all the major mount tops have benchmarks pounded into the ground somewhere. If you can find the benchmark, you have the location, and sometimes the altitude. For example, for Mt Hamilton:
<http://www.waymarking.com/waymarks/WMQ1J_Mt_Hamilton_1960_ECC>
The problem is that mountains tend to move every time there's an earthquake. Even without earthquakes, the distance between Mt Hamilton and the Farallan Islands moves about 5 cm per year across the San Andreas fault.

I think this might help if you're trying to locate a tower on Mt Hamilton:
<http://www.ucolick.org/~sla/mtham/gpos.html>
   "The vertical positions are not as well known and may
   be off by 10 meters. "
Well, maybe not...

My objective was to determine my full Maidenhead before there were web
applications to find it.

I just took my portable, WAAS enabled, aviation GPS to the back yard and
let it average for a couple of minutes.

Since then I discovered why I kept getting different results pre-GPS (long
boring story about map accuracies); turns out the dividing line runs
down the sidewalk across the street.

Some GPS receivers will deliver the Maidenhead grid square directly.
<http://www.n7cfo.com/vhf/gps/~gps.htm>

Chuckle.

We're close to that problem at the local club station (K6BJ):
<http://802.11junk.com/jeffl/pics/drivel/slides/grid-cm8x.html>
I had to post this map because operators were constantly calculating
the wrong grid square.

Nearby, is the local intersection of the lat-long lines.
<http://confluence.org>
<http://confluence.org/confluence.php?lat=37&lon=-122>
Notice the wide variations in photos by people thinking they've found
the correct location. The problem is that the real intersection is
located on a poison oak infested steep hillside. We posted a DGPS
located marker, but people keep stealing it.

As it turns out, my house is in the very SW corner of DM14fco7, with the front in DM14fco7ae and the back in DM14fco7be.

<mandatory antenna content>

If you go to http://no.nonsense.ee/qthmap/ and enter DM14fco7be the white dot in the middle of the back yard is the box covering an SGC autotuner for the 33 foot vertical.

A screwdriver antenna may work better than the Hi-Q loop. I'd check at
eham.com reviews.

For us, probably any reasonable answer would suffice - but why not pick the most accurate for starters is what we're thinking.

> What level of accuracy is really required?
> The original position of 37.337408N -121.644073W is specified
> to 1 millionth of a degree, or about 0.09 meters.

A few feet would probably work just fine for the neighborhood. We each have acres of land, but the terrain is so rough that only a few spots for antennas would be useful. That's why we want to choose them ahead of time.

> It would be interesting to know where this highly accurate
> number came from.

We didn't want to put our actual location on the net, so, we picked an arbitrary set of numbers from one of the elevation calculators just as an example. But we're in the roughly 37,-122 range.

> What datum are you using? I suggest WGS84.

WGS84.

We have some numbers in NAD83 from the various WISP providers but they drive us crazy since we have to imperfectly convert them to WGS84 to keep our numbers consistent.

> Are you interested in ground level, building rooftop level,
> or tree top level?

All three because we want to site a dozen or more antennas which need to have clear line of sight over rooftops and trees by at least the first Fresnel zone.

Interesting quotes from that helpful reference (with my comments in parenthesis).

"In the Continental United States the difference between WGS 84 and NAD 27 can be as much as 200 meters." (I wonder how they handle the constant creep which occurs out here near the San Andreas fault line).

"Every map that shows a geographic coordinate system such as UTM or Latitude and Longitude with any precision will also list the datum used on the map." (I'd change "will" to 'should' based on my experience the past two weeks on the web)

"The Global Positioning System uses an earth centered datum called the World Geodetic System 1984 or WGS 84." (That's what I prefer.)

"For all practical purposes there is no difference between WGS 84 and NAD

83." (Good to know.)

"On a USGS topographic map ... The datum will always be NAD 27... A dashed cross in the SW and NE corners of the map gives a visual indication of the difference between the two datums." (This is good to know.)

"If you are engaged in a mission that requires more [than several hundred meters] precision, then your datums should match." (Since we're siting antennas on private hilly land, we probably want two or three meters accuracy in position and a half-meter to a meter in elevation accuracy so our datums must match.)

What I mean by that is that it's a right-slip fault, and it moves by centimeters to inches each year (sometimes in feet to yards, both in elevation and in position) ... but ... how do they know if the west side moved north or if the east side moved south?

I wonder what they use for their frame of reference since it depends on which side of the fault you're on if you want to say the west moved north or that the east moved south.

Ok. Go thee unto:
<http://www.cplus.org/rmw/english1.html>
Follow the destructions at:
<http://www.cplus.org/rmw/download/download.php?S=1>
For maps, download the SRTM3 maps for your area from:
<http://rmw.recordist.com>
Do not bother with DEM, SRTM1, or other maps. Do NOT unzip the maps. My directory shows about 600MBytes of SRTM3 data for everything for the SF Bay and Monterey Bay areas. You can set Radio-Mobile to automatically download a map if needed, but it's easier to just download the maps ahead of time.

Follow a simple example such as:
<http://www.cplus.org/rmw/afirst.html>
to get started. There are also numerous tutorials on the web. Note that the program uses the concept of "networks" which will be key to modeling a mesh. Locate your nodes, use realistic values, and build a model. This part is a PITA and requires considerable time and effort. Draw the (optical) coverage areas for each node, and the line of sight:
<http://joelgranados.wordpress.com/2011/11/05/wireless-link-calculations-radio-mobile/>

You're going to have a big problem in the Santa Cruz Mountains call trees. These are cellulose and water obstructions that may or may not appear at the correct altitude on the elevation profiles. 2.4GHz will NOT penetrate foliage, especially when wet. You'll need to manually adjust your path profiles for the tree line. If the trees are inside the Fresnel zone, you'll have losses.

If you have problems, ask here, or preferably the Yahoo Radio-Mobile group at:
<http://groups.yahoo.com/group/Radio_Mobile_Deluxe/>

I have a really bad attitude about mesh networks. Bug me if you want to hear the full rant. For a sample, see the dismal performance of an early mesh network (MIT Roofnet -> Meraki).
<http://pdos.csail.mit.edu/roofnet/doku.php?id=interesting>

> "Surprisingly, the performance over a two hop route is less than 1/2 that of one hop routes, implying routes tend to interfere with themselves."

Also:
<http://sha.ddih.org/2011/11/26/why-wireless-mesh-networks-wont-save-us-from-censorship/>
covers the main problems. Do you really want a phone call at 2AM from a neighbor asking if the network is down?

Some years ago, I got in a major pissing contest with a high ranking Dept of
the Army civillian because he wanted a study of zero bandwidth transmission.
His theory....with zero bandwidth there would be no noise, and thus an
infinite signal to noise ratio.  They are still out there......

This is an interesting antenna HAAT (Height Above Average Terrain)
program ... but I'm not quite sure what use it is because it gives a 360
degree average height ... but most 2.4Ghz antennas I'm dealing with are
directional.

You enter the latitude, longitude, & height of the antenna, and then it
tells you, for example, for 360 degrees, the average antenna height above
ground for 2 to 10 miles along each radial, the result of which can go
negative.

The output is a text file. It's interesting, but, without graphics, I'm
not sure how to use the results properly when just going point to point.

We simply must repeal the laws of physics - they just get in the way.

Upon further looks at their document, it looks like they are putting
that continual twist on the signal by cutting the parabolic dish, then
moving one side of the cut a little closer. Apparently that makes the
signal twist continuously.

Bloody hell, they should have saved that for April 1st.

I wrote that before you disclosed what you were trying to accomplish.
Had your intent to obtain accurate altitude readings been for the
purpose of applying for an FCC station license, you would have needed
the HAAT calculations to estimate coverage area. For building you
mesh network, you don't need HAAT calculations.
<http://en.wikipedia.org/wiki/HAAT>
The first paragraph should explain what HAAT means.

>The output is a text file. It's interesting, but, without graphics, I'm
>not sure how to use the results properly when just going point to point.

Hint: You can always take a table of number and create a graph or graphic. Going the other direction is not so easy. Most propagation and antenna design software generates an output table (text file), from which a graphic is later generated.

I've used Radio Mobile and SPLAT!. I never got a warm and fuzzy with

Radio Mobile. Of course, it is a bit more complicated to use SPLAT!.

One obvious advantage to SPLAT! is it can analyze very large areas. Not
all that useful in the case of this wifi setup, but very useful in sigint.

Oops. I meant the SRTM1 maps.
<http://dds.cr.usgs.gov/srtm/version2_1/SRTM1/>

>I've used Radio Mobile and SPLAT!. I never got a warm and fuzzy with
>Radio Mobile. Of course, it is a bit more complicated to use SPLAT!.

I've used both. Radio-Mobile has a very steep learning curve.
Important functions are buried deep into obscure menus, useless trivia
is scattered all over the menus, there's no logical sequence of
operation, and many of the terms require expertise in cartography.
Debugging errors is tricky as important items, such as the performance
characteristics of the radios, are scattered over a half dozen menu
pages. I find myself constantly referring to my cheat sheet in order
to get anything done. However, I haven't found anything else that
even comes close to what it does.

>One obvious advantage to SPLAT! is it can analyze very large areas. Not
>all that useful in the case of this wifi setup, but very useful in sigint.

<http://www.qsl.net/kd2bd/splat.html>
Splat is somewhat easier to use, but as you note, is designed to
display repeater coverage. It's less useful for close in coverage, or
showing coverage details, as in mountainous or urban jungle terrain.

Both programs put considerable effort into implementing complex
terrain models. For 2.4 and 5.7Ghz, optical line of sight is close
enough.

Is that suppose to be some kind of thanks for doing your research?
In the future, if you need assistance, get it from someone else.

RM mostly runs under Wine:
<http://radiomobile.pe1mew.nl/?How_to:Wine>
The problems listed are not fatal as you can download the SRTM maps
manually, and can simply export the result as a Google Earth overlay
to obtain street map detail.

My recollection of Radio Mobile is you need to crank down the minimum
angle that it sweeps to get any accuracy. Like I said, I prefer SPLAT!
for the accuracy. Even so, it is only as good as the NED. However, if
SPLAT! says you can see it, then you can see it. I thought Radio Mobile
was simple to run, at least for one transmitter at a time. Far easier
than SPLAT, which requires compilation parameters to set the array size.
Radio Mobile, at least when I read it, was stuck at 3600x3600. If you
```

exceed that array, and note it uses a 1/3 arc second grid, the program interpolates.

The grid is 10 meters on a size for 1/3 arc second. That means you can't "see" more than 36km. Plenty for wifi, not so good for repeaters or even photography.

I generally do two runs with SPLAT. First I check the altitude when the radio is to be located. If it doesn't match the topo map, I add the difference in altitude to the transmitter height. Then run it again.

I have a 90 mile path to analyze, so I guess I'll see what these programs can do lately. But if Radio Mobile is stuck at 3600 pixels, that is a show stopper.

If Alpha Male has linux, why even screw with Radio Mobile? Just run
SPLAT!. For a small array, the KML SPLAT generates should be fine for
Google Earth. My issue was the array was too big to feed GE directly.

GE has an "aperture" size that doesn't appear to be consistent between
PCs. GE expects the images to be tiled with no tile larger than the
aperture. On my PC, that is 3600x3600. That is probably why you could
load the Radio Mobile output to GE.

Incidentally, there are programs designed to take a PNG and tile it, but
I never got them to work. But it has been a while since I tried them.

True.  1 degree resolution at perhaps 20km is:
  tan(1deg) * 20km = 350 meters
resolution.  Not great resolution, but good enough for wide area
coverage.  For wi-fi, the range is much less, so the "squares" shown
on the map will be correspondingly smaller.

Samples of wide coverage area RM calcs.
<http://802.11junk.com/jeffl/coverage/k6bj/>
We recently moved our tower and antenna, when the building that
previously supported them was demolished.  So, I recalculated the
coverage.  I believe I used 1 degree resolution.

I'm too lazy to check the numbers right now.  Maybe tomorrow.
Meanwhile, this article claims that Splat is limited to 3600x3600
while Radio-Mobile is limited to 2000x2000.  No clue at this time
who's correct.

>I have a 90 mile path to analyze, so I guess I'll see what these

A 90 mile PATH (line) is quite different from a 90 mile radius
coverage (area) radius.

Looks like the balloon trackers have the same problem with Radio Mobile Deluxe.
<http://showcase.netins.net/web/wallio/RMD.html>

> "The 2000x2000 software elevation matrix limits paths to 2000km for 1000m data (30-arc second), 200km for 100m data (3-arc second) and 130km for 30m data (1-arc second)."

Now, go away so I can get some work done...

Hi Engineers,

I'm Starting a new FM Station Project in BENGHAZI - LIBYA which is 60km2 in area, i was advised to use a transmitting system of a 600w Transmitter attached to 4 double dipole antenna (http://www.labelitaly.com/website/akk2.html) as my tower specs are : tower angle 4 leg (leg size = 10 x 10), parameter at 96 m height = 2.5m x 2.5m. attached a picture of my tower.

i want to get an omni-directional coverage as my tower is located in the center of the city and I've been told that unless a panel antenna the tower will make a shadow or something like that to the broadcast signal.

i want to know if i'm really forced to use a panel antenna in my system, why i can't use a high power regular dipole antenna.

and please advice if the transmitter power i'm using will be enough to cover the 60km2 area.

hope to find help here.

Thanks in advance.

Why are looking at a flat panel directional antenna when you want a omnidirectional antenna?

Nothing attached!

You might be able to use a simple sleeve dipole, ground plane, or suchlike at the top of the mast if that's vacant and you can get an antenna that's happy to work as the lightning finial, but the antenna gain will be low to the intended service area; possibly less than 0 dBd, particularly in the case of a ground-plane antenna (upward-tilted VRP: radiation pattern in the vertical plane). For police communication at similar frequencies in the UK, four two-element yagis around a pole were used at the top of the structure, the pole actining as the finial. Usually, two such arrays were stacked vertically. The small radius of such an array gives a good omni HRP (radiation pattern in the horizontal plane).

An advantage to using a circular array of panels is that it can be positioned below the top of the structure (e.g. if the top is used for television) and you might achieve a minimum of 0 dBd if the handovers between adjacent panels are well controlled (or fortunate!). At many stations in the UK, a number of tiers of panels are used in order to provide gain and to facilitate a split upper/lower half-array system for resilience. You could try to get the antenna supplier to measure four panels on a stub tower of the same cross-section as your structure, but if you're only buying a one-off they might charge you a premium for perefoming the measurement. It would demonstrate unequivocally what the final system would achieve HRP-wise, although, depending on the height of the stub tower (or time-domain gating, etc.) you might still need to infer the VRP.

A service area of 60 km^2 would have a radius of 4.4 km if it were circular - is yours? The required ERP depends on the required minimum field strength at the limit of service. For simple spherical spreading, taking no account of antenna VRPs and reflections/multipath, E=(7/r)sqrt(ERP) ... which can be found in ITU texts and is easy to derive from first principles ... so if you were to use, for example, a minimum field strength of 5 mV/m (stereo, in a large city with lots of sources of interference, using low-gain receiving antennas) at r=4.4 km, then ERP=9.9W. If your service area isn't circular, say it extends out to 10 km in one direction, then to achieve 5 mV/m at 10 km would require ERP = 51.0 watts. A 600 watt transmitter into an antenna system with a net gain of, say -3 dBd (accounting for VRP, HRP ripples, and combiner/feeder/power-splitter loss), would provide an ERP of 300 watts so, in the latter case, a margin of 7.7 dB. This would provide some resilience to multipath fading (although P-P=0, no matter how large P is!). In other words, you probably wouldn't need a higher-powered transmitter in this case - but it does depend on the shape of the service area, and on your definition of 'service'.

Hope this helps.

Chris

Another reason for using panel elements is to facilitate horizontal polarisation, which was popular in the UK (but perhaps for a questionable reason) - nowadays, most stations use mixed or vertical polarisation. When the majority of the listener-base is located in vehicles, VP is a better choice principally because of the typical receiving antenna.

Chris

Yes. I'm just mentioning cranking down the angle to save someone a few
meaningless runs. It didn't occur to me to do the math as you suggested,
but it makes perfect sense.

I was running the beta version of splat-hd. I could do 6 degree x 6
degrees at 1/3 arc second. Each degree is 3600x3600, so I could do
21600x21600. If you want to do "mountain-topping", you need that kind of
span.

Looking at the overlays I generated, I had to hack the output into 12 to
20 blocks, 3600x3600 at a time, to make it google earth compatible.
Hopefully the new version does this automatically.

I believe this was the program I was trying to get to work to do the
cookie cutting. Looking at the bug report, it still looks like it has
issues.
> http://www.maptiler.org/

I got really good with GIMP to do the cookie cutting. Still a PITA.

> - Why are looking at a flat panel directional antenna when you want a
> omnidirectional antenna?
> Mikek -

First sorry that i forgot to attach the picture of my tower, it's
attached now in this RAR File :

http://www.mediafire.com/?cse8yiyn5d4jtd9 .

I'm Forced to use panel antenna cause the person i'm buying the antenna from told me that my tower specs can handle nothing but a panel antenna to get the desired coverage cause if i use another system of antenna the tower will make a shadow to the transmitted signal and that's an information i don't trust, the panel antennas are so expensive and heavy for shipping so i'm asking for a replacement for those antenna that will work with my tower and gets me an omni-directional coverage.

can you verify this information?

> - You might be able to use a simple sleeve dipole, ground plane, or

> HRP (radiation pattern in the horizontal plane). -

Unfortunately i'm renting a place in the tower which is 80 m high and the parameters of the tower at 96 m high is 2.5m x 2.5m so it's not gonna be small in radius for the antenna system.

> - A service area of 60 km^2 would have a radius of 4.4 km if it were

Ok let us Stick to the 600w transmitter, i'm not an expert in waves calculations glad to have such help from you, you can see exactly the picture of the tower and the position of it in this RAR FILE http://www.mediafire.com/?cse8yiyn5d4jtd9 , attached also a placemark from google earth for the tower location in the city, Benghazi's surface has a lot of area exposed to the sea at the north west, and there are hills at the south east, i only want to cover the residental area in between which is a cicule of 15 km of radius, getting a wrong pattern antenna will waste most of my signal into the sea, please recommend me an antenna system which works with the 600w transmitter and the tower specs i mentioned (tower angle 4 leg (leg size = 10 x 10), parameter at 96 m height = 2.5m x 2.5m) and also for the geographical charecteristics of the city and also want to get use of the gain of the antenna i will get to strength the signal (my tower is the one at the left)

thanks in advance

--

I don't have software to read .rar files - perhaps you could provide links to .jpg photos that can be read by Windows without needing to download a reader program.

If the aperture you're renting is at 80 m on the 96 m tower then, clearly, you don't have access to the top so you can't use a simple omni-directional antenna. If you mount a half-wave dipole any reasonable distance off the face of a tower with side dimension similar to the wavelength then the resulting HRP will be directional (viz the 'shadow' principle you mentioned, and reflection off it). You may be able to use one or more such directional patterns if your service area isn't uniform around the antenna but if your aim is consistent coverage at all angles around the structure then you will need to mount an antenna off each face, and that's the purpose for which panel antennas have been designed - to achieve controlled hand-over from one panel to the next so ripples in the HRP are minimised. It isn't trivial to predict the radiation patterns of an antenna next to a metal structure and many manufacturers offer sytlised patterns based on averaged measurements. One manufacturer has already been named by amdx and there are many others you can Google (e.g. RFS, Alan Dick, R&S, Harris, etc.).

However, since your service area covers a limited arc, bounded by sea and hills, it sounds like you don't want an omni-directional HRP at all - more a precisely-tailored directional pattern. It would probably take range measurements using a stub tower to get that right - but it all depends on how precise you need to be (e.g. on the definition of your coverage criterion).

You will need to do some research into this (or pay someone to do it for you) if you don't trust the advice you're being given by a supplier. There may also be regulatory issues to contend with. It goes without saying that you shouldn't base your purchase on anything written in this or any other newsgroup!

Chris

Katherein Scala antennas makes some very nice low power Yagi-Uda transmit antennas.

Come on hams

You know the antenna I am talking about. I seen its specs online about 10 years ago. It is a single omni aluminum antenna with three traps in it. About 19 or 21 foot long. Made for ground use, no ground planes or radials, and old style. This is an older style antenna. Regular coax hook up. I need to remember the name of this antenna so I can make sure its lenghth and specs are correct. Gotta be an old ham out there that remembers these old style omni antenna.
Thanks

There were many versions of trapped verticals sold in the last 30
years. Without pictures of the base or traps, hope of identification is
fairly slim.
Sounds like the typical Cushcraft or Hustler. Or at least those were
the most popular versions.
Also, ground mounted verticals will still need radials if the antenna
is to live up to it's expectations. And there is nothing to stop one
```

from using one elevated, if one uses resonant radials for each band to
be used.
Look at the tubing and see if it has any marks on it from it's previous
assembly. Often, the clamping will leave marks on the tubing, and one
that was used for a long time will usually show discoloration between
the tubing exposed to the air, and the part that was covered due to
the overlap.

My GAP Titan DX requires no radials; it is a center fed, asymmetric
vertical dipole.

The OP should try using Bing or Yahoo. Here's the Yahoo Ham Antenna group:

Well, ground mounted monopoles in his case..
Being a "complete" antenna, it's true that the center fed vertical does
not require radials for proper operation, but you would still likely
show lower ground losses if it were over radials.
For instance, broadcast stations that use 1/2 wave radiators still
use a set of radials under the antenna. Usually 1/2 wave radials, when
used with a 1/2 wave radiator.
You will still see some ground loss with the ground mounted 1/2 waves
over poor ground, but being as the max current point is 1/4 up from the
ground, it's not near as severe as the ground mounted 1/4 wave where
maximum current is at the base.

I don't think a ground screen is needed if you are > 1/2 wave.

If you elevate a short vertical you only need a few "ground" radials
(think CB groundplane antenna), btw. My whole transmit antenna system
floats on my roof. The only "ground" is the panel where the RF goes
through the wall. I receive on a balanced 30m horizontal loop, also
floating except for the point of entry. I have an automatic tuner at the
feedpoint under the eave by my kitchen window. (FWIW) I have lived here
14 years and have never seen lightning at the shack.

It's not required to provide the lower half of the antenna, but
they will still reduce ground losses if the antenna is ground mounted.

The number of elevated radials needed to equal certain number on
the ground will depend on the wavelength above ground.
IE: to equal 120 1/4 WL radials on the ground, at 1/8 WL, you will need
appx 60 of them. At 1/4 WL, appx 8-10.. At 1/2 WL, 3-4..
And if the radiator is short, the radial system is a bit more
critical than with a full size 1/4 wave radiator.

I bet their halfwave is sitting on a bed of 1/2 WL radials.
Most 1/2 wave BC antennas tend to use 1/2 wave radials I'm fairly sure.
Part of this is due to FCC requirements for stability in performance,
etc..
A 1/2 WL radiator on the ground is not immune to ground losses.
It just suffers less than the 1/4 WL.
And a 1/2 wave elevated, really should be decoupled from the feed line
for best performance. Of course, it's not required, but they will
perform better if you use decoupling. Less skewing of the pattern
off the horizon, from feed line currents.

Found it

Actually, I found some very old schematics , the paper is yellowish tea like. Japanese I think . Hidaka.

http://www.hidaka.com/e-a_multi-v.html#VS-41W

I am pretty sure the one I have now is the VS-80KR.

I am going to clean it up and try it out. Don't know what will happen when I put it on a 50 ft tower in these windy days. Will have to calculate the length of gnd planes. I suspect they will be too long.

Any recommendations?

Thanks

73

Not really, as the antenna in the picture seems to use
loaded/trapped radials. So you will need their assembly
specs if you have those and plan to use them.
Or maybe assemble them and try to tune them.
If elevated, any full size wire radials will need to be resonant.
If ground mounted, there is no need to tune radials laying on or in
the ground.

I don't have the ground planes for this antenna, just the vertical main mast.

Used on the ground would be difficult because I am sandwiched between houses all around me.

I wonder would the mismatch be so significant that the efficientcy of the antenna be almost completely lost? If used with a good tuner would the radiation resistence of the antenna become totally innefficient if I were to completely ground it out through the tower? Nice idea having a omni all hf band antenna. I run barefoot anyway.

I think I will try it out anyway, I have one of those MFJ old manual tuners and am sure it would match the feedline coax with the antenna to the load. Just curious how efficient the antenna would radiate. Being 50 foot above the ground, approx 500 ft above sea level anyway. I think the deciding factor is that there is nothing on top of the tower now anyway.

Thanks

73

WGS84 is a geographic coordinate system: it's referenced to the Prime Merid=
ian and the Equator, not to any ground landmarks locally.

the digital elevation data is "accurate as of the date of collection".  If =
a fault moves or someone engages in a big earthmoving operation, then the d=
ata set won't reflect reality.
```

As to the practical problem of determining plate movement? Easy if you hav=
e GPS, because GPS is referenced to WGS84, and WGS84 is referenced to a spe=
cific geoid, anchored at the equator and the prime meridian. In turn, one =
can use celestial landmarks to calibrate it.

Hey y'all - I'm new to this web site. I have an old Cushcraft R7
vertical antenna that's going up one more time. It was new in '92 and
got took down by a tree in a tornado storm in '96 in Zion, IL. I fixed
it up and it spent the next five years above my mom's garage in Rocky

River, OH. I took it down and it's been mothballed since. It's going up again because I cannot decide between other antennas. It is most definitely a compromise, but I do not contest or compete, and the ground here on the gulf coast is pretty salty, so I'm giving her another try.

This is so much fussing. I really need the two meter yagi up and running.

I wish y'all every one the best.

Nice antenna, looks pretty practical.

Good luck

It's one of the best antennas I ever used in over 50 years
of hamming. I've had wires, towers and beams, but the
R7 was great! I never considered it a compromise. If you
do have problems with it, just google it and you can get
all the information you need to fix it quickly and easily. You
shouldn't have problems though. I set mine up according to
the manual and it worked perfectly for a number of years until
I moved into a senior's lodge and coudn't take it with me.

Thanks! The R7 worked well for me and later for my mom. I had it up on a ten-foot mast in Zion, IL. A nice op up in Kenosha, WI about twelve or thirteen radio miles to the north also had an R7 up on his garage and we could just about pin each other's S-meters on 40 with 100 watts. The tornado storm caused a big tree to fall on one of the 3/16" Dacron guy ropes and the antenna bowed severely, but I was able to fix it (the insurance paid for a new one!).

At some time during one of several Navy moves the counterpoise spokes and the x-hat rods were lost. I ordered replacements from MFJ and it took them five months to get the parts to me. A local ham has advised me to wipe the aluminum a few times per year with WD-40 against the salty air here on the Gulf. One concern is the longevity of the fiberglass base insulator in the South Texas sun, and I am contemplating coating it with roof tar. Any suggestions along this line are most welcome.

Dunno.. I think I would use something else.. That roof tar can
really get to be a mess if you have to work on anything.
And it possibly could effect the fiberglass being an oil type
product. Don't know how it's built, but maybe heat shrink tubing,
or some coating that wouldn't be so messy. IE: I'd much rather use
black color weatherstrip adhesive to cover it, than roof tar.
It will dry to be like rubber, and could be peeled off if needed.

No telling how it will tune. If you use no radials, the whole

structure will be acting as the antenna. Radiator, and tower.
Results could be all over the map depending on the band. It would
be better to have at least one resonant elevated radial per band to be
used.

Yes I agree. A big tube of heat shrink custom cut sounds much better.

This was an excellent antenna for me, and I set it up for my mom prior to a Navy transfer after my dad passed away. She had very good luck with it. I'm glad to finally have all the parts again. The R7 was really good, especially on 30 meters for me. I will forget the roof tar! I'm sure it would work, but what a mess! I need to open the box that contains the feed circuitry and verify everything is nominal, and check it all out. This should be a good location for the R7. Thank y'all for the excellent observations. Ric

  Have you seen the product called "Rescue Tape"
Resisting salt water and UV rays are a couple of it's
characteristics. I bought some at a hamfest, but I saw it yesterday at
West Marine.
It doesn't leave any sticky residue when you remove it.
Here's the website.
http://www.rescuetape.com/
       Mikek

I don't work for the company, but I did stay at a Holiday Inn.

Thanks for the information.
I think it is very top heavy, and up on a 50ft tower will just wait for a
good wind to bring it down.

While I see no ground plane brackets with this, there is no way to put gnd
planes at each section.

Haven't done nothing yet, maybe wont. Maybe will.

Thanks for the information.

73s

 A party you are more familiar with than I, since this is the first I've
heard of such a thing.

  You seem intimate with such gatherings, however, since you are the one
in command of the jargon.

  You lose.  Again.  Your norm.  FOAD, you retarded twit.

IKYABWAI. Typical response of sub-morons who don't have the mental acuity
to understand things more difficult than "pull this tab to open".

No surprise there.

>  You lose.  Again.  Your norm.

How much glue/acetone/spray paint do you have to sniff to actually believe
what you write?

>FOAD, you retarded twit.

I hope you get cancer and die screaming, and your family bribes the
hospital staff to withhold your morphine.

>Especially if it was pitched by Billy Mays (R.I.P) ;-) Sincerely,

I got my start in antennas and RF reading Popular Electronics with advertisements for "Turn your house wiring into a gaint 1000ft TV antenna". Inside the magic box was a "capacitator". Plus the AC-DC TV chassis into the wall the wrong way, and sparks would fly. After getting shocked a few times, I figured that anything that powerful was worth learning about.
<http://books.google.com/books?id=4NsDAAAAMBAJ&pg=PA33&lpg=PA33>

Roll forward half a century, and I'm still reading (and writing) about electronic hoaxes (and science fiction business plans). The shocks are largely gone with the demise of tubes and the introduction of low voltage transistor devices. I don't miss getting zapped that much.

Additional entertainment. Turn your your house wiring into a 2.4Gbit/sec internet connection. Different names, different technology, more dollars, but everything else the same:
<http://www.wired.com/wired/archive/9.11/media_pr.html>

Drivel: I had to build a peak audio detector and AGC to reduce the average TV audio level specifically to keep the Billy Mays commercials from shaking the house. It sorta worked, but with some side effects. After he died, I was able to safely remove it.

Don't assume that all nanotech antennas are science fiction. See:
<http://en.wikipedia.org/wiki/Nantenna>
<http://www.inl.gov/pdfs/nantenna.pdf>
These may possibly be the future for solar energy conversion.
The main advantage is the high 85% efficiency, which unfortunately
has yet to be demonstrated. The maximum theoretical efficiency
for a multi-junction type solar cell is about 38%. For a common
single junction, it's about 20% max. The nantenna is basically a
dipole antenna, resonant at light wave frequencies, with a built
in rectifier. Small is beautiful.

However, nanotech solar power doesn't have anything to do with nano
capacitor antenna spray.

  Stupid fucktards like you deserve the slowest, most painful of deaths.

  You should be vivisected, and then doused with alcohol., and then
slowly be fed to a wood chipper, feet first.

  That is the kind of death retarded abusive fucks like you deserve.

I am desperately seeking the article 'An Antenna For The Travelling Man'
from
the April 1967 QST.

Gotta build something to get me back on the air ASAP! :-)

Any assistance would be greatly appreciated.
Tks

     Jeff is da man!
1967? Jeff you ought to throw something away once in a while.
I even threw my Playboy magazines from the early 70's away,
about a year ago. They had some mighty fine looking 50+ year
old women in them!

I cheated and downloaded it from the ARRL web pile.

When we had our last big earthquake in 1989, most of the damage to my
house was done by my magazine collection falling over and flooding the
kitchen and hallway. I was walking on top of a 2ft "carpet" of
magazines for about a month until I was able to haul them off. As I
vaguely recall, the magazines filled 3 heaping small pickup truck
loads. After the magazines were cleared, I discovered that their
weight had caused the sub-floor to buckle, and pull away from the wall
framing. Beware of magazine collectors syndrome. These days, I
recycle more often and read online. Much better.

You should have saved them and sent them my way. At my age, 50+ is
starting to look just fine.

I used to have a b&w ap-10 and it worked quite well. I tuned it by
adjusting the length of a single radial across my apartment rug. MFJ
makes a window-sill antenna that looks awfully similar:
http://www.mfjenterprises.com/Product.php?productid=MFJ-1622

The user manual is online, and you can probably order the little
bugcatcher-style coil a la carte.

   Not sure if you got my little joke there. In the early seventies
the women were 20 yrs old to today they are 50+, but they look real good
in the magazines for 50+ yr old women... My seventeen year old son was
not happy to see me through them out before he got a chance to peruse.
  I have a collection of QST from the 80's in the attic, thinking maybe
```

I should move them so they are at least sitting over a wall, for support.
   Mikek

I got my ticket in 1957. I was always collecting junk from others,
By 1982 had accumulated a full collection of QSTs back to the 50's.
I also had all CQs back to the mid 30's, and miscellaneous other
radio mags. I had some 30 ft of shelving in the shack which eventually
collapsed. I didn't need an earthquake! It took a week of
gathering the mags off the floor, going through them all for
articles on antennas mainly, which I clipped and saved,
then disposing of old mags a bagful at
a time in a local unprotected dumpster. No other hams
wanted them.

I think I will rejoin
ARRL -- I left them in '86 for the Canadian Ham organization
mag, but realize now that the ARRL archives are a valuable
source of useful info.

Thats a good idea. Ceiling in my daughter's room has a sag in it
because of my mags.

My favorite sport was digging through the dumpster behind Henry Radio (in Smog Angeles) or various Radio/TV repair shops, for parts and pieces. I would haul the carcass home on the bus (don't ask) and tear them apart in my parents garage. These days, I go to garage sales, thrift shops, flea markets, and buy on eBay. The results and quality are about the same.

<http://802.11junk.com/jeffl/pics/drivel/slides/mess02.html>
No earthquake required here. Just my lousy job of attaching the shelving to the drywall and overloading the shelves. Gravity always wins. It took about a week to clean up the mess and reattach the shelves.

A clean shop is a sure sign of someone that pays retail:

The ARRL archives QST from December 1915 through December 2007. More recent issues are not available online.

Well, 12 issues of QST weighs 8.0 lbs and are about 3" thick
(compressed). I had a pile that was 10ft long, about 6ft high, and
two rows deep. Mostly EDN, Electronic Design, RF Design, various
microwave mags, etc. My guess(tm) is that it was about 120 linear ft
of magazines. At 32 lbs per linear foot, that's 3,840 lbs.

Shortly after getting my ticket I spent nearly a year in OKC going to
computer school living in a 2 story apartment. To get on the air I use
about 15 ft of EMT conduit and built a little LC tuner of scrounged Cu
tubing  and a cap out of a 5 tube AM radio. Picked up a CB VSWR meter
at a yard sale for a tuning indicator. Later picked up an MFJ tuner at
a hamfest, wahoo. Balcony railing was my counterpoise.

I spent 26 years in the Navy ('57 to '83) moving from place to place. Whether onboard ship, in navy Quarters, or after marriage in apartments and houses, I always managed something similar. Following retirement I became somewhat of an expert in helping other hams setting up concealed or low profile stations. I had a marvellous collection of assorted parts and pieces with which I could easily throw something together. Two years ago, following a serious illness, I sold my house and moved into an assisted living facility. I donated all my ham radio equiment, books, junkbox, and so on to the local ham club -- a real 50 year old treasure collection which I wish I had today! I'm well again, or at least well enough that I'm going back into hamming -- starting from scratch. I'm really looking forward to being on the air again,
As we say in Calgary, aka Cowtown, Yahoooooooo!

Good for you Irv, and I'm glad you are doing better.
Modest antennas can be fun, particularly when sunspots cooperate!

I'm in a lot more pain lately, and I'm having a harder time controlling my temper. I am dropping a lot of things, between carpal Tunnel & nerve damage to my hands. I am also tired of hearing lies from doctors. For some reason, my medication for enlarged prostrate was put on hold for 90 days, and not being able to sleep more than an hour or two at a time is starting to get to me after two months without more than four hours sleep a night. There are days that I want them to cut my damn legs off, to get rid of the constant pain. they hurt when I lay down. They hurt when i get up. They hurt when I'm sitting, and when I'm walking. I have been waiting over a year for the proper surgical support stockings, only to be told a few days ago that it's no longer available. I waited over five years for a pair of diabetic shoes. I couldn't find anything that fit, so I was wearing a pair of old shoes that should have been tossed three years ago. 10 years ago my feet were 8.5 wide. Because of Diabetes and circulation problems, they are now 11 EEEEEE (yes, 6E) and some days I have trouble even getting those on. I have 'Turned the other cheek' so many times that I no longer care.

Sorry. I had it right when I first inscribed it. Then, I made a few
edits and corrections, where I introduced the usual amgiguities and
incoherence.

However, this offers the chance to rant a little. I renewed my ARRL
membership about a month ago. A few days later, the third renewal
notice arrived in the mail offering a free book if I would renew. One
of the books offered looked interesting, so I sent email to the ARRL
asking if the offer could be made retroactive for those that actually
pay on time. No answer, yet. I wonder what would happen if I let the
membership lapse... perhaps an offer of two or more books? Grrrrr.....

Some of these magic antenna claims are at least a little entertaining.
This one was just boring.

Jimmie

Apparently, you must have attended the recent CES show, where
technology is sold by highly entertaining, minimally boring,
professional models.
<http://www.lvmodels.com>
<http://www.emmegirls.com/Trade_Show_Models.html>
<http://eventmodelgroup.com>
Compared to those, magic antennas are not even a close second.

There were a few magazines some years ago that I would let the
subscription lapse purposely. They always had a deal for new subscribers
or those who come back. Like half off the subscription price.

Good plan.  I just received an email from ARRL member services asking
which book I might want.  Of course, I picked one of the antenna
books.

Thanks. However, it wasn't a difficult decision. The options were:

- More Wire Antenna Classics Vol 2
- HF Digital Handbook
- Emergency Communications Handbook
- ARRL Repeater Directory
- Extra Q&A
- General Q&A

The difficult part will be to find a slot in the bookshelf. It's crammed full of books with no space left for more.

Another mistake was to renew for 2 years, instead of one year. I might have been able to get one book per year that way. Oh well.

I just rejoined ARRL and have been able to download many archived antenna articles. It wasn't exactly a renewal since I dropped my subscription back in 1986. No free books for me but I've got all I need now off the net.

Anybody have decent plans for an eggbeater for use at the top of a tower?

It has to protected against weather.

Best 73,

Alan

Alan,

Google the Texas Potato Masher antenna. That may be helpful. There is an
article in pdf format on this:

http://victrolla.homeip.net/wo5s/junkpile/432/tpm2.pdf

```

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35f23326

the rec.radio.amateur.moderated Moderation Team had decided to consider |
amending its charter, and permit limited simultaneous crossposting to
rec.radio.amateur.moderated and one other unmoderated
amateur-radio-related discussion newsgroup. After a successful trial |
period (90 days, through early July 2009), we decided to adopt this |
change permanently. |

Approved rec.radio.amateur.* newsgroups are those that are currently listed in the latest version of the "List of Big Eight Newsgroups" which is crossposted monthly to news.announce.newgroups, news.groups, and news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those that have been created consistent with the suggestions in "So You Want to Create an Alt Newsgroup" at:

  http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either "radio.amateur" or "ham-radio" in their names, including uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may still choose to reject articles crossposted to any alt.* newsgroup with an inappropriate name, including obscene language, embedded name-calling, or encouragement of unlawful conduct.

Please direct any comments, questions, or criticisms to rec-radio-amateur-moderated-request@panix.com.

I am working on a project for school in which my group must design a robot that can remotely locate a beacon emitting a 433 Mhz signal. We are using array of two dipoles and phase monopulse comparison to make multiple angle bearings of the beacon, to which we will later apply some processing to provide a location of the beacon. Our robot will travel a straight path and we will know which side of the path the beacon is on.

We are using a mesh screen behind the antennas to direct their radiation path toward the beacon. We were wondering whether we should position both the screens parallel to the path we are traveling, or have the screens facing 45 degrees outward in order to get more directionality on the signal?

Here are some images of the two proposed designs. The black circles are the antennas, and the green lines are the mesh screens. Both images are top view:

The first design: http://i.imgur.com/79r4T.png
The second design: http://i.imgur.com/2oH5H.png

Thanks in advance for any help. Advice is greatly appreciated.

- Billy Maier

I have used XMLOG (shareware) for some time on XP and on Windows 7. It has many many advantages and works with many rigs to automatically enter time, frequency, and mode.

Further it has a good interface to LOTW.

For further information see www.xmlog.com.

Hi
Thanks for the reply.

My rigs are older and dont support interface hook up. Iam looking for a logging software that doesn't need hook up to the rigs.

Other than pad and paper, slate and chissel

Something independant and not reguired to hook up to the rig. I know there are a couple of old dos programs, not looking for that.

Thanks

73s

The second 45� thing does not make sense to me.
You increase the capture range but decrease directivity.
Will the antennas rotate?

w.

MoCA is home networking, hence the 300 foot figure. A drop at +10 dBmv already allows a 25 dB loss for the cable modem, since they are designed to work to -15 dBmv. That webpage also mentions verifing that a "drop amplifier does not block Moca". In other words, it's home networking for multimedia devices and has nothing to do with the length of the cable drop. It is to allow customers to stream audio and video within their home, and use services like Netflix & Hulu on their TV sets.

I bet that all the stations gave you a 5x9 report also.

Go to a country that is on the rare list and you can put up a wet piece of
string and get 5x9 all day long no  mater how many times you have to repeat
the calls.

During good conditions almost anything will work.  It is under bad
conditions that a beter antenna system pays off.  I have a beam up 60  feet
and some wire antennas around the same height.  Most of the time the signal
levels are such that I can hear the same stations off either one.  There are
times that I work stations off the beam with good received signals that I
can not even hear on the wire antennas.

Where do you live? The parts of FL I have seen were are technologically
advanced, I guess. This stuff is rolled out here in CA, big time. Things
like the DCX3200M box and their DVR are MoCA.

In case you've missed it, MoCA has already release 2.0. More than a year
ago ...

It is the modern cable TV, like it or not. Companies not playing will
likely be packing some day. Personally I doubt it'll do much for home
networking, at least not appliance control. Computing, yes, and that's
the new game in town. Cable companies offering "all-in-one" packages
where you get phone, Internet, TV and all that from the "company store".
Pretty pricey, last time I looked it was $99/mo and that only for the
first year. Probably goes up afterwards.

Hi Jeff,
I don't seem to be able to follow your directions, I don't think I
have enough buttons. To get the info I posted, Push and hold the power
button until the power light blinks, then push power again and the info
screen comes up.
I don't know what the MAIL light is, I don't have a select button nor

a INFO button.
  Hey started pushing buttons on the remote, found I can scroll through
15 pages off stuuf I don't have a clue about.

Got some "RF Statistics on page 5"
  Current FDC
  Freq. 75.250
Level 5 dbmv
S/N 29db
Errs/Ave 0/0

Current Qam
Freq. 513 Mhz
Level -1dbmv
S/N 35db
Errs/Ave 11/0 or 11/1 or 11/3 but mostly 11/0

  That's all I can see.
               Mikek

Sigh. You never back down, even when you are shown that you are wrong. You are wrong and it's eating you alive. Even the title of the article in your link states: "Testing And Deployment: Making MoCA In-Home Networking Easier" and the article starts with: "Market growth and competition for enhanced video services revenue have MSOs and telcos scrambling for technology and operational advantages. In the next decade, consumer electronics with embedded Internet and IP video support will be widely available." No where does it mention a cable drop. It is a method to transmit digital data between a DVR and any TV connected to the system. Nothing more. It's no wonder you can't get a computer to run properly, when you can't even read a simple networking article like this and understand it.

Show me anywhere in that article that states a 300 foot cable TV drop is required. The word drop shows up twice and the first is part of another word:

```
   1: "Additionally, the technician can monitor the MoCA channel for
 bit errors based on corrected or dropped MoCA packets."
                                  ^^^^

   2: "A drop amplifier that does not bypass the MoCA spectrum."
         ^^^^
```

This means that some installations require a bi-directional amplifier to compensate for long drops just as they always have. 'Drop Amplifier' refers to a single output CATV amplifier as opposed to the multiport CATV distribution amplifiers used in apartment complexes and condos.

> Companies not playing will likely be packing some day.

Maybe in 30 years, when tiny rural systems can't find anything cheaper on the market and upgrade in bits and pieces. YOU know all about being a cheapskate.

> Personally I doubt it'll do much for home networking, at least
> least not appliance control.

Why should it? Why would your DVR need to talk to your refrigerator? It is strictly a streaming system for home Entertainment. It's been available here, for years. Hell, even my dad's Direct TV sat system w/DVR does it. Appliances don't need a TV tuner and other crap for a simple ethernet interface.

Computing, yes, and that's the new game in town. Cable companies
> offering "all-in-one" packages where you get phone, Internet, TV
> and all that from the "company store".

Phone and internet are delivered via a cable modem that works to -15 dBmv.

> Pretty pricey, last time I looked it was $99/mo and that only for the

> first year. Probably goes up afterwards.

It goes a hell of a lot higher than that. That $99 doesn't get you basic cable, internet and phone here. Add on more tiers and hgher bandwith internet and it can pass $250 a month.

You are so ignorant that it's scary. Read ALL of the page you linked to and look at the images. It is a lousy home network via coax streaming media standard and nothing more. Not that I ever expect you to be man enough to admit you are wrong. Everything is always someone else's fault. No one ever does anything right but you. The fact that you design medical electronics scares the hell out of me.

--
You can't have a sense of humor, if you have no sense.

```

It shows that you have a 6 dB slope, and the high end is 1 dBmv below the standard level. It also shows a lot of errors in the recovered data. QAM is the digital TV signal. Unscrambled channels are referred to as Clear QAM

<Yep.. My mobile antenna in it's longest "parked" config is a 14 foot
<tall whip, and the loading coil is at 8 or so feet up from the base.
<It browns the food quite well on 80 and 40, mounted on my large Ford
<truck.
<The base of the antenna is on the side window pillar, about 2 feet
<below the roof line.
<snip>

Some years ago, I was in a 40 meter net, along with a local buddy. My antenna was a dipole at about 30 feet, and he lived in an antenna restricted condo. So, when he got home from work, he connected the coax from the home rig to his mobile bugcatcher on the car. Night after night his signal reports were excellent.

Probably not an explicit resistor, but some sort of network that is
really lossy and has the same effect. There's a variety of this sort
of thing around. Radio Shack used to sell a wideband vertical with a
funky looking ferrite transformer. Looking up the patent, you could
get the schematic, and basically, it was a 10-15 dB loss over a
pretty broad band. Not too tough to get a 1.6:1 SWR with a 15dB pad
in the system (in fact, I'd be amazed if the SWR was ever as bad as
1.6:1)

The odd thing is, such things DO work. When propagation is hot, an
extra 10-15 dB of loss isn't even noticeable.

Presumably 75.25MHz is an analogue signal? In the UK, at least while the
cable system has carried a mixture of analogues and digitals, the
digitals have been run 10dB below the analogues. If 75.25MHz had been
digital, it would be set at -5dBmV, so there would be a rising slope of
4dB, LF to HF.

In any case, if the 513MHz digital is -1dBmV, and other HF signals are
similar, that is more than sufficient for a digital set-top box. I would
think it should work reliably down to around -15dBmV. If I'm right,
whatever the problem is, it isn't being caused by a lack of signal
level.

Because I am not.

http://publicservice.vermont.gov/consumer/cons_alerts_cable.html

Quote "If its under 300 feet, its free to the consumer".

Yes, it is as simple as that. You are within 300ft and the cable company
must serve you. This is state-of-the-art. Now you'll probably declare
the whole State of Vermont to be wrong?

:-)

But it's everywhere. Here is an example from South Carolina about what
happens when a company wants to push through a sub-par 125ft and the
city insists state-of-the-art 300ft:

http://www.redorbit.com/news/technology/329657/
orangeburg_city_council_adopted_franchise_without_cable_company_agreement/

They threatened to not renew the franchise. And this was six years ago.

At night, my mobile antenna was usually better than my home dipole
on a path from TX to FL. "40m" I discovered this after talking to a
guy from the car, and then switching to the dipole when I got home.
My signal dropped. :(  And it was no fluke. I tried it several
more times, and the mobile won most every time.

It's just the mobile antenna being better at that lower angle,
than the dipole, which at 35 feet or so, probably was better for
NVIS, than longer paths.
Of course, in the daytime, the dipole smoked the vertical on
all the shorter paths.
But I've never had any trouble being able to operate running
mobile on 80 or 40 meters. Even the short regional paths on 80m,
I was always able to work the people I wanted to. Often with
quite decent reports for a mobile in a NVIS world.
Would be quite normal to get reports of 20+ DB over 9 on most
peoples meters. Sometimes 30 over 9. And that's on a fairly short
80m path of less than 500 miles.
My mobile antenna in the "driving config" is 11 feet tall.
It's about 5 feet under the coil, and 5 feet above it. The
coil itself, being about a foot.
I add a 3 foot solid hustler mast to make it 14 feet when
I'm parked. Then, it's 8 feet under the coil, and 5 over it.
Makes quite a difference.
But I'm only set up to use those on my trucks now.
I still have not been able to bring myself to cut holes
in my newer Toyota..  :( I know if I do, it's eventually going to
warp the trunk lid, like it did when I mounted it on an Honda Accord
```

I had. Even with reinforcing under the trunk lid, it eventually
slightly warped the area around the hole. And this is with a
light mostly glass antenna. Mine is a "plastic bugcatcher". :|
So with the Toyota, I just go without, and just take the radio
to use when I get where I'm going.

The speaker needs classes in public speaking and basic antenna theory.

<http://www.chamtechops.com>
Spray on some nano capacitors, and you get instant gain, apparently in
all directions? No way.

Since when do police radio antennas get hot?

When propagation is hot, an
extra 10-15 dB of loss isn't even noticeable.

Like 10m today. Path from Florida to West Coast was like a land line around
1900Z.

Failure to maintain eye contact with the audience indicates several
possible problems. In this case, my guess is that he's totally unsure

of himself. Test antennas in a Faraday cage? The audio track is probably good enough to run a voice stress analysis lie detector, but it's late, and I'm tired.

I can guess where he got that idea.

* Kulrod technology: only by larsen.
All Larsen antenna whips feature the exclusive Kulrod plating system to assure superior performance. This consists of 3 plated (Copper, Nickel, Chrome) which allows an increment of its radiation capacity and reception signal and avoiding overheat.

The problem is that the skin depth at VHF/UHF frequencies, the skin depth is less than 1 micron, which is much less than the probably 20-50 micron plating thickness of the various layers. However, if the skin depth did go through multiple layers, the dissimilar metals might cause PIM (passive intermod):
<http://www.rfcafe.com/references/calculators/skin-depth-calculator.htm>
Never mind that all decorative chrome plating is over layers copper and nickel, in order to get decent adhesion. See "Decorative Chrome Plating" section:
<http://www.finishing.com/faqs/chrome.html>

>I actually got the YouTube link from Steve Gibson's (GRC.com) news

Since the CEO says that technology was "accidentally" discovered, I can also suspect that aliens were involved in the technology transfer.

>I certainly don't claim to have seen it all, but I've been around for

I randomly collect articles on electronic hoaxes and bogus patents. Unlike this one, some are really clever and well done. Thanks for the entertainment.

Sometimes I feel quite sorry for you, Nymbecile. Can it really be the
case that you don't realise that you are the easiest wind-up ever?

The sad thing is that you can't see when you are being wound-up.

> The whole state? Na, there's probably three sane people left.

The FCC says the requirement is 100 feet in CFR 47-46.606, section three, quoted below:

---

(3) The visual signal level, across a terminating impedance which correctly matches the internal impedance of the cable system as viewed from the subscriber terminal, shall not be less than 1 millivolt across an internal impedance of 75 ohms (0 dBmV). Additionally, as measured at the end of a 30 meter (100 foot) cable drop that is connected to the subscriber tap, it shall not be less than 1.41 millivolts across an internal impedance of 75 ohms (+3 dBmV). (At other impedance values, the minimum visual signal level, as viewed from the subscriber terminal, shall be the square root of 0.0133 (Z) millivolts and, as measured at the end of a 30 meter (100 foot) cable drop that is connected to the subscriber tap, shall be 2 times the square root of 0.00662(Z) millivolts, where Z is the appropriate impedance value.)

That mess in Vermont involves Adelphia cable, and the settlement of a huge fraud lawsuit. They agreed to build to a minimum of 14 homes per mile, when the industry usually stops at 35-40 homes per mile as ever paying back the construction costs. Vermont had them by the balls, if they wanted to renew their franchisee. Adelphia is also heavily invested in FIOS.

The other franchises I looked at only had a 300 foot limit if it was Fiber to the structure, which doesn't have the roll off and insertion loss of coax.

Here is a typical RG6 from Belden:

Freq. (MHz)	Attenuation (dB/100 ft.)
5	.67
55	1.60
211	2.87
270	3.24
300	3.43
350	3.72
400	4.00
450	4.26
550	4.71
750	5.59
870	6.00
1000	6.54

This shows the loss at 12.78 dB at 450 MHz which would be a very old system.

The sad thing is the actual state of mind, and lack of maturity of those doing it.

And they would call themselves civil.

You are not even in the same boat. Sub-humans don't get to be rated with us.

Last year, I bought a Larsen 2/70 antenna and mag mount base.
I couldn't figure out why it didn't radiate all that well.
Got home and looked at the antenna.
Said to myself - you dummy - you didn't remove the paint from the base portion of the whip.

Even with the screw tightened to the point of where it made a dimple in the whip - it still was not making good contact.

I put it on the wire wheel, removed the paint, put some Nolox down in the hole and tightened with the allen wrench and have had no problems since.

To date - my best hill-topping was about 100 miles on 2 meters and 440 in the hills of Pennsylvania.

Even at that - the mag mount is a poor conductor - because there is a rubber pad over the magnet and you cannot get a good bond to the vehicle body unless you remove the paint under the magnet and the rubber insulator.

I Went to a Ham Fest last year and saw a couple of the antenna parts for a couple of dollars each and like a dummy didn't buy them.

If you have the magnet mount and the loading coil - you can use any old antenna you want. Just cut it to length and stick it in the hole.

As far as getting rid of what I have, because something better came along.
Antenna technology peaked about 1971 when the CB radio was the fad.
In those days if you wanted a decent antenna for a decent price - there was enough manufacturers out there to take your money that you didn't have to look or travel far to find them.

When the accountants took over the antenna business, it wasn't long before the quality went away and the big beam antenna's were replaced by cheaper - less efficient models that were more profit friendly to the manufacturer.

You can only sell a $100 antenna for so long before you either have to ask your employee's to take a cut in pay, or you ask the engineers to find a way to make it cheaper.

Mobile antenna's are no different.

Hello, all, and I watched the entire video from Chamtech. There have been many firms over the years attempting to develop conformal antennas (primarily for military/shipboard use) that were supposed to either equal or exceed the performance of conventional antenna designs in the operating frequency range. This is the first "spray-on" one I've seen.
As for the Chamtech presentation:

1. Since when do antennas on police cars get hot to the touch?

2. It seems clear the presenter is a marketer with scant knowledge of antennas/electromagnetic theory. IOW ignorant of the underlying basic physics (which can also apply to Hams, sadly). If Chamtech's technology actually works, it won't be due to the mechanism(s) claimed.

3. Dubious operating range performance claims, especially in a submerged environment (I sure would've like to have been present for the underwater tests.)

4. All this reminds me of the crossed-field antenna (CFA) saga.
Sincerely, and 73s from N4GGO,

My guess(tm), is that the coax cable between the radios and the
submerged antenna was doing the radiating. At 50MHz, the leakage from
3 watts of tx power should be sufficient to get 3 miles.

Losing touch with the other end of the link is predicatable. At 6ft
above the water, the visual horizon is 3 miles away.

The picture of the submerged antenna seems to be a biquad antenna,
which looks much too small for 50MHz. Each loop would need to be 1
wavelength long or about 30ft circumference. See 8:25 minutes into
the video.

I think someone sold the antenna-ignorant presenter a bill of
goods which he in turn thinks will sell like hotcakes.

indeed..

Or, maybe, since it's a misunderstood but actually functional
technology, the one where a stream of salty water passes through a
suitable coupling network. Lame, but works. Better than the CFA.

The alien visitation theory is mine. My logic is that since the technology was "accidentally" discovered, and since the CEO is obviously lacking in scientific expertise, there can be only one possible remaining source for the technology. It came from outer space, handed down by an advanced civilization. When obvious sources of the information do not lead to a generally acceptable consensus, the traditional default explanation is advanced alien knowledge delivered by flying saucer.

I don't think it's the green card aliens that are processing nano capacitors into antennas. Their level of expertise and technology is usually lacking. The H1B visa visitors might be a better possibility. However, most of those are smart enough to recognize a profitable technology and will usually prefer to take it back home with them.

Somewhere I recall seeing an article on homebrewing a windowsill antenna similar to the B&W AP-10. Does anyone have a copy they could email me, or a link where I can find the information. I was hospitalized for serious problems and all my ham gear including many books were donated to the local ham club -- I'm starting again from scratch after 54 years of hamming, but on a much smaller scale!

Thanks for any assistance in this matter.

I don't know of a specific article, but

  http://www.bwantennas.com/instr/Ap10b.pdf

is the instruction sheet for the final version of the antenna. Page 2 shows a fairly decent physical diagram of the antenna coil construction.

Basically, the antenna appears to be a telescoping whip, with a large air-core inductor / loading coil mounted below it. A flying lead is used to short out some of the turns on the coil, in order to set the amount of inductance. A variable-length counterpoise wire is used; both the counterpoise length and the loading-coil fly lead setting must be adjusted for each band in order to get a good match.

You could probably either use a piece of Airdux inductor stock, if you can find one at a hamfest / flea market, or wind your own inductor on some sort of suitable form (perhaps PVC pipe?).

It looks like a fairly standard "small antenna" approach.

Addition of a small LC tuner at the base (homebrew, variable cap + recycled roller inductor?) might save you some time during setup and band changes, by reducing the need to fiddle with the counterpoise length and position to get a usable impedance match.

Mobilfunkmast aus der Spraydose

Schlechter Netzempfang k�nnte bald schon der Vergangenheit angeh�ren. Das US-Startup Chamtech Enterprises hat auf der Zukunftskonferenz �Solve For X� von Google die Antenne zum Aufspr�hen vorgestellt.

Das Spray soll gro�e, senkrechte Objekte wie B�ume oder W�nde durch simples Bespr�hen in Funkmasten verwandeln k�nnen. Organisches Material in der Spr�hflasche soll dabei verschiedenste Magnet- und Radiofrequenzfelder, selbst unter Wasser, aufbauen k�nnen. Das Unternehmen will damit vor allem Mobilfunkunternehmen ansprechen.

Cellphone antenna for sprayers

Vertical objects like trees or walls can be converted to cell phone antennas by spraying. Organic material will result in electromagnetic resonating fields even below water

http://blog.ziggytek.com/2012/02/13/chamtech-introduces-low-power-spray-on-antenna/

Hope it's not Scamtech.

w.

>>you're not worth the time and effort.  As you were...

>You did not put forth any effort, you lying piece of shit.

Correct.  I supplied the minimum necessary for you to notice that
there is a problem.  Think of it as a mirror in which you see the
results of whatever it is you're trying to accomplish.  You are trying
to accomplish something, or you would not expend so much time an
effort on something so trivial as insulting everyone within range.
From your response, it wasn't very difficult to determine that you're
not responsive to any feedback, criticism, or suggestions.  I know
when to give up, which is precisely what I've done.

Incidentally, the mirror isn't such a bad idea.  Look in the mirror
and ask yourself if what you see is what you had once intended to
become.

>You had no
>intention of putting forth any effort either, you lying piece of shit.

Not true.  Had you responded with even the slightest interest, I would
have burned considerable time and effort explaining my observations,
offering recommendations, and generally trying to be helpful.  (Punch
my name into Google Groups search and see for yourself.)  You can
start the cleanup exercise by losing the profanity.  If you claim to
be a knowledgeable professional, the first step is to act like one.

>You are just like all the "intelligent" cops out there.
(...)
```

You probably have no idea how much you reveal about yourself with such comments. Your search for self-esteem is the surest sign of its lack.

```

I never said it wasn't.

I will say that you match its sad quality, however. You ain't all that, tom. You jumping into your assessment bullshit proves that.

You do not know me, and you do not know ANYTHING about me, so stop making presumptuous remarks, you fucking bastard! You wouldn't have a nose or a jaw left in person!

These fuckers I have been calling retarded in here wouldn't either, if on the first day I ever called them a retard, the response was in the form of a stroke across the face for what they said that caused me to call them a retard to begin with. But the details go over your head pretty quickly, eh?

You jumping on their bandwagon is a serious character flaw, and I spot it immediately, idiot. And that is why you get the moniker even before you think you did anything wrong. Just getting in their fucked in the head gossip sessions makes you a convict, asswipe.

And you are such a dumbfuck that you say I need to seek help? HA!

I bet your employers just love you.

I mean, you are so eloquent.

It would be interesting if someone could forward these harmless posts to
your employers.  Ahh, it wouldn't matter though, they love you.

No, idiot. I moved the line, and simply failed to delete the original.

But I wouldn't expect an immature little bitch like you to have any vision of reality, even when it is right there in your face.

Just remember,dipshit. *You* are slow scan. *I* am at a rate in which the very first packet carries more data than the entire set that encompasses what you have passed in your entire life.

Hell, my ride to work with GPS and cell, and my droid playing a movie is a bigger datagram than anything you ever fucking did.

And THEN, the guys I work for and strive to give more, better, and faster data to EACH get a bigger datagram than an old fuck like you was ever worth.

Remember what I said about your mother? Now, go back and read your first response to me, and discover why it is that YOU are the uncivil fucking bastard in this thread. You don't get to live in both worlds at your fucking leisure, and at my expense boy.

```
  You mouthed off, and you got it back in your face.  YOU are still the

Why are you so angry? You've been cursing and ranting here all day,
flailing at everyone.

This isn't healthy. All that anger will wreck your immune system and
make you old fast. You'll stroke out eventually, and not have much fun
meanwhile. Really.

You are too goddamned blind to see WHERE the problem is located.

I have been telling you all there is a problem for years!

Were I to say "Are you all ready to be nice now?" there are always six or eight who still want to take jabs, and then it ensues again.

You getting it yet?

If you all want to be nice, we can do that, but you can bet someone will start again, and THEN I will reciprocate. I play by those rules of engagement. That is why YOU got schmacked. Because you are on the stupid, snide remark bandwagon too. Character compromises shall not pass.

So, get started on *them* as well.. and yourself, Jeffy Fixit. Every time I try to be like anyone else, an army of idiots start with their sub-Jr High mentality horseshit. They will get their plates of shit back in their faces. Don't you go thinking you can start feeding me one too, boy. And then some dope thinks that because I cuss, I am wrong from the start. That is pretty stupid too. Call them "colorful metaphors".

I have the entire archive. Nearly two decades. The names these idiots use to refer to me with do not match any I have ever used. They can have that back in their faces. Cussing doesn't mean a fucking thing. You getting it yet?

I can chronicle every time each asshole started it, from over a decade ago in some cases.

Good story. It brought to mind a promotional video I saw for a company that had a process called explosive bonding (of dissimilar metals). They must have been too cheap to rent lights, so they did the demo outside on an old wooden table. It was two guys in overalls and, I swear, they could have retitled it "Gomer and Bubba Find Some Dynamite" and nobody would have noticed.

>You probably have no idea how much you reveal about yourself with such comments.

Wait until they pull your son over, and then there are five cruisers, complete with their ss dogs, doing their piggery shake down.

You are the one who has no idea.

Over 50 folks a year die in the US alone. The numbers around the world are greater still.

They get trained to NOT aim at the chest area, but guess where the dumbfucks all aim.

Did you see the PIT 'stop' down in Fla earlier last year where they had like 4 dudes in the car, and the driver got like 3 tasers, and each occupant got a couple each, and they ran out of tasers before they could taze the fourth guy? Did you see that video?

Did you see the whole line of cars that were in the left turn lane that the PITed car slammed into the last one as it rotated and stopped?

The band of pigs that endangered the public that day arrested that guy like the jack jawed jackasses they are too. Do you know why?

In medical I tend to push the envelope and so do the standards
committees. Sometimes based on what we do. I designed all my cardiac
stuff defibrillator-proof, always, although it was not the law yet. Then
they made it law, because it makes sense.

Believe it or not but I like to have to meet specs in medical because
they protect people. Including you.

>   ... Would you like to pay
> an extra 20% to 30% just so a very few locations can get better

Out here we do not pay extra. Our cable companies out tend do use modern technology, not cheap stuff from the 70's. A cable company that isn't competent enough to do more than a measly 100ft would lose their franchise rather quickly.

Oh, that's right. You're too cheap to even have cable TV.

Read more carefully. I said TV doesn't matter to us, it is not about cost.

Sorry Jeff but I never used my connectors to support my cables. You may be right but completely irrelevant to me. To me F connector and good connection shouldn't even be used in the same sentence. They are what that are, cheap connectors at best that uses the center conductor of the cable for a contact. Now that is Yech. Heat shrink has nothing to do with the pull test or hiding poor workmanship but it does help keep corrosion down which is the biggest problem with F connectors. Ive never seen one pull apart except in the shoddiest of installations. One of the best things I have found to insure you maintain a good connection is to apply something like DeOxit to the connectors when you assemble them. Best done while all the parts are new.

Jimmie

You are correct that the problem is in the hex crimp and part of this is because they started making the crimp made on to the connector. The other part is that you have to have a special tool to crimp them. All the pictures that you showed are require a special crimp tool. If these tools are worn or dont fit the particular plug/ cable combination you will get a bad crimp. The old style that is probably 40 years old now that you could crimp the little ring with a pair of pliers worked the best. Unfortunately you can no longer get them, well I do have a few.

Jimmie

There little wrong with good quality F-connectors. They are generally good enough for what they were intended for. Problems are usually down to who installs them, and how.

For personal outdoor use, I always give any connectors a squirt of WD40 - both during and after installation. [I guess DeOxit would be similar or better.] After cleaning off most of the WD40, I then seal with self-amalgamating tape. Obviously, heatshrink would be better, but for me, is usually less convenient.

Mechanically, even screw-on Fs can be hard to dislodge, provided just the right amount of braid is trapped under the screw thread. However, I suppose that sometimes they might not provide the ultimate in screening.

In the UK, in the large CATV networks, crimped connectors are well and truly a thing of the past. Anyone using them (even the good ones) would be liable to be hung, drawn and quartered, and then severely punished.

The standard connector is of the 'Snap and Seal' type (and similar). In themselves, these are pretty well watertight, and the screening is excellent. It should be almost impossible to pull one off the cable.

However, it is unusual for F-connections to appear naked in the open air. The final RF distribution to the home is invariably from a street cabinet which houses an optical node or an RF distribution / line extender amplifier feeding a bank of taps/splitters. The 'traditional' cascade of in-line taps has not been used for a very long time. Under these relatively benign conditions, the F-connectors probably suffer much less from corrosion than those used on taps hanging on aerial messenger wires, USA-style. Nevertheless, there are various purpose-made short 'chunky' rubber sleeves which can be installed first on the tap ports before the cable connectors are screwed on. These seal the screw threads. Personally, I would have liked to have seen a bit of WD40 used but I never managed to drum up much enthusiasm for this as an approved practice.

No. I know for a fact that paddles were applied while a system of ours
was connected. The doc should have first pulled the plug as the
procedure calls for, but didn't. The witnessing engineer almost froze
but the patient interface held. If it hadn't someone would most likely
have died. I had designed it defibrillator-proof even though the
standard did not (yet) require this.

>   You discounting standards in other areas is casual lameness, ...

Like where? And what particular standard? Quote, please.

[...]

>Moonrakers?  LOL.  Ok now we have you calibrated.

  No, you do not.  I was 12 years old, and the gear was my dad's.  You
have nothing, and you know nothing.  All you do is presume, and you
presume wrong, boy.

  The antennas I work with now are everything from 18 foot diameter
gateway heads to yagis for the military that we get in 20 foot long
crates that put anything you ever worked with to shame.

  You should go see someone for that multiple personality disorder you
are sporting there, "we" boy.  More like "wee boy".

>  I suppose Giant Rat of
>Sumatra was your "call sign".

  If you had any clue at all, you would be familiar with where the name
comes from.  So you fail there too, asshole. No surprise that you are a
cultureless twit as well.

 That pretty much means that *I* have YOU calibrated.  You are a total
loser, or you would remember the art. The fact that you do not means that
you were a drab loser fucktard back then as well.  My fingernail
clippings have more on the ball than you do, idiot.

  Bwuahahahaha!

You do it because they wouldn't hire you if you couldn't meet specs, just like every other consultant, engineer or tech. They might even jail you for your incompetence for not meeting the specs.

> Believe it or not but I like to have to meet specs in medical because
> they protect people. Including you.

Believe it or not, most technical people have that same standard. You're nothing special.

> franchise rather quickly.

Once again the all knowing Jeorge shows his ignorance.

1: You don't know what you're talking about, about the cost of service. Any extra operating costs become part of the basic service that everyone pays. You won't work for nothing, and the utilities don't give them free electricity. The service companies don't repair the equipment for free. Do you have any idea how many amplifiers, taps and set top boxes are needed for 10,000 active ports? To provide hotter ports require more amplifiers, and raises the system noise floor. You 'designed an amplifier'. Big deal. A lot of engineers 'designed and amplifier' and those companies are long out of business. Current CATV amplifiers use hybrids designed specifically for the application and they use them for many reasons. That just leave the design of the 60V modified sine wave to DC power supplies, equalizers, gain control, equalization and remote switching. Some locations also have remote monitoring so the headend can check system status on a continuous basis. It can also report outages when some of the equipment doesn't respond. They can even detect power failures and monitor the battery status in the standby power supplies to give them time to get a portable generator to the area if it is an extended outage. The local Brighthouse system remained in operation here for over four weeks after a hurricane even though the only way to watch TV or access broadband was with battery power or a generator.

2: '70s CATV tech was 12 channel with no return path. It was crude, discrete point to point designs that looked like a ham put together from junk TVs while drinking cheap beer. They were touchy as hell, their tempco sucked, and they were impossible to service without a fully equipped test bed. the power supplies were simple, poorly regulated linear supplies with 85 C electrolytics that died quickly in the southern sun. The large diecast aluminum housing ran hot to the touch without the sun hitting them. That stuff was pretty well all scrapped out by the mid to late '80s by 36 or more channels with return capability. There was so much construction of upgraded systems that there was a severe shortage of new hardware through most of the mid '80s.

That '80s tech was gone in all but the smallest systems by 2000. Today most systems are 450 MHz or higher, and are 'Fiber Enhanced' to provide telephone, broadband, movies on demand and pay per view services by breaking the system into cells that cover a few hundred homes, or less.

3: You know nothing about CATV franchises. 'A measly 100 feet' is more than adequate for a hell of a lot of drops & house wiring. If that is what the franchise calls for, THAT IS THE SPECIFICATION, no matter how much you whine like Sloman. A city or county won't pull a franchise over one or two people complaining about weak signals. They receive a fixed percentage of the system revenue every month, and the percentage was set when the economy was up. If they pull the franchise, another provider will offer a much lower percentage. It also involves legal fees, and causes the rates to go up for the users. Why put up with all that for a fraction of a percent of problems. Like people who built a private road a mile long and want to pay the standard install fee when it will cost about $15,000 to run a feeder for that one house. Or like that marina. It isn't a street. It's private property. If they want better service, let them pay for upgrades with .500 cable to each boat, with a .500 to 'F" connector for each boat. That would only cost a few hundred dollars a boat for materials. More if the cable is jacketed. If it isn't it won't last long in salt air. Double that for the hardware and labor to get a good idea of the costs.

> Oh, that's right. You're too cheap to even have cable TV.
>
> Read more carefully. I said TV doesn't matter to us, it is not about cost.

Then why are you being such an ignorant prick about the issue when you have no horse in the race? You sound more like Dimbulb every day. I used to think highly of you, but no longer

Then you would hate most microwave connectors lit SMA.

You didn't need heat shrink on good 'F' connectors.

Not needed, if you use flooded outdoor cable.

   A 'special tool' that only cost about $20 and would do thousands of
crimps before it was worn out.  I've bought them new, on sale for $8
US.  You admitted to using pliers on the cheap crap, and you certainly
can't do that with a hex crimp.

Which one are you?

http://www.forward.com/articles/127941/

"A schmuck is, in short, someone who lacks not intelligence, but all
insight into what is humanly appropriate and what is not. This makes his
condition remediable. A schlemiel, a schlimazel and a schmendrik are
irredeemably what they are. A schmuck can be enlightened. He can
acquire, through a painful process of self-examination, the moral and

social understanding that he has been missing. He can become, to revert to Wex�s dichotomy, a mentsh."

<JIMMIEDEE123@YAHOO.COM> wrote:

>Sorry Jeff but I never used my connectors to support my cables. You
>may be right but completely irrelevant to me.

Umm... you've never tripped over a cable, had the equipment fall off
the table with the cables attached, run RG6a/u up a pole to where it
has to support its own weight, moved furniture with cables still
attached, flexed the connector when used as a test lead, pulled cable
through the wall or conduit with connectors attached, etc? These are
all very common situations which will stress the connector to cable
connection. While it might not be a problem for a fixed (stapled in
place) installation, it certainly will be a problem for the average
home user.
<http://802.11junk.com/jeffl/pics/drivel/slides/mess01.html>

I find it odd that outdoor CATV uses quad shielded cable to prevent RF
leakage and ingress, and having the cable swept to perfection, while
you recommend using inferior F connectors.

>To me F connector and
>good connection shouldn't even be used in the same sentence. They are
>what that are, cheap connectors at best that uses the center conductor
>of the cable for a contact. Now that is Yech.

I do have some issues with RG6a/u that uses copper plated steel core center wire. Mostly, it's a corrosion problem for outdoor connections where the home owner does their own wiring, and uses F connectors without the necessary rubber o-ring needed for waterproofing. I've swept F connectors on the bench and find them quite good and often superior to the rare 75 ohm TNC and BNC connectors near the top end (2GHz for satellite). Incidentally, most of the antennas (that survived a recent storm) on my roof use RG6a/u coax. The mismatch loss between 50 and 75 ohms is minimal. Some use F connectors, but most use BNC's made for RG6a/u.

>Heat shrink has nothing
>to do with the pull test or hiding poor workmanship but it does help
>keep corrosion down which is the biggest problem with F connectors.

Ahem. I worked for a marine radio company during the 1970's. I learned a few things about waterproofing and corrosion. Heat shrink doesn't work. Capillary action along the heat shrink to connector boundary will suck the water into the connector.

What I use (when needed) is a layer of 1" PTFE tape (or 1/2" if that's all I can find) over the connector. Once in place, a layer of Scotch 66 or other electrical tape to hold it in place. The PTFE will cold flow into the irregularities on the connector surface, and there will be zero capillary action. If I want UV resistance, I spray the tape with clear Krlyon (acrylic) spray.

While we're on the topic, I've experimented with various allegedly waterproof enclosures and packages. The only ones I consider genuinely waterproof are sealed and pressurized with dry air. Anything less will eventually leak.

>Ive never seen one pull apart except in the shoddiest of
>installations.

I have and all too often. I was at the neighbors trying to troubleshoot their Comcast cable tv and modem mess. They had some friend of theirs do the wiring. All the F connectors were crimp ring type and were falling apart. The coax was mostly RG-59 with maybe 80% coverage. I replaced the most disgusting and will finish the job when I have time.

>One of the best things I have found to insure you
>maintain a good connection is to apply something like DeOxit to the
>connectors when you assemble them. Best done while all the parts are
>new.

DeOxit and Cramolin contain oleic acid, which will slightly corrode copper. It's good for CLEANING connectors by removing the oxides, but should not be left on the connector. If you want to make sure that you can take the connector apart after the threads rot in place due to galvanic action between the aluminum receptacle, and the nickel plated crimp type F connector, some silicon or lithium grease would probably be better.

Some notes on the contents:
<http://www.antiqueradios.com/forums/viewtopic.php?t=82058&start=40&sid=71ca160c8f607686916a0f355e9ecc34>

>Jimmie

As for special tools, I love them. My various cable preparation tools for various coax cable have saved me countless hours of fumbling with a pocket knife and diagonal cutters. Using the various compression tools on F connectors almost guarantee a good connection, unless I did something dumb. Same with crimp lugs, various LMR-xxx coax cables, and Anderson Power Pole connectors. The days of using a hammer or vice grips to crimp a connector are over. The cost can be substantial, but is well worth it if you work with connectors regularly.

Correct. And the spec for a competent cable company is typically 300ft,
as I have shown in the link. Plus the one below.

Never said I was. Except that I do exceed standards at times where I believe it is necessary. In the case of med electronics that has likely saved lives. I do not subscribe to the idea that a standard is always good enough. Because sometimes they are not.

No. I suppose you know what MoCA is. Do you consider them ignorant? Because they say the very same thing that I said. What matters is today's state-of-the-art. Nobody cares about what it was in the 80's. Today this is state-of-the-art:

http://www.cablefax.com/ct/sections/features/Testing-And-Deployment-Making-MoCA-In-Home-Networking-Easier_44237.html

Quote "The Multimedia Over Coax Alliance (MoCA) provides a standard ..."

then

Quote "The maximum cable distance supported between the root and the last outlet is 300 feet, with a maximum attenuation of 25 dB". And this is for MoCA, not just cable TV.

If that company can't do more than 100ft they'd fail miserably in our market. It's not just our house, it's also the neighbor to the west, and the one after that, and ...

No, it is not. If you don't believe me check out Cameron Park, CA, especially the area of the Estates. Then tell me how you want to do that with 100ft drops.

> ... If that
> is what the franchise calls for, THAT IS THE SPECIFICATION, ...

And the franchise would get kicked out of the market around here. You can't serve this market with a sub-par spec. The big automotive companies had once exhibited a "Well, this is the spec and that's that" attitude like you do in this thread. Then they learned, the hard way. In part by essentially going on welfare which was embarrassing.

> ... no matter
> how much you whine like Sloman. A city or county won't pull a franchise
> over one or two people complaining about weak signals. ...

They will if there's a whole big crowd showing up at the next meeting. Now I won't because I only watch the evening news via antenna. But I know a whole lot of folks who would be miffed to be declined service because they are literally addicted to the sports channels. Many would just get satellite though, they market that quite aggressively these days.

> ... They receive a
> fixed percentage of the system revenue every month, and the percentage

> provider will offer a much lower percentage. It also involves legal
> fees, and causes the rates to go up for the users.

The county folks have one much more important thing on their mind: How to get re-elected. That's what'll matter most to them. They know that seeing complaints about what many people perceive as a utility service they have "rights to" in the paper is not the way to get re-elected.

> ... Why put up with all

Then answer a question I asked you before but you did not comment on it: Why did Mike's cable provider not decline service? Obviously it worked reliably in the analog days and now with DTV it doesn't. If they can't handle the 170ft drop after the digital switch, why did they not inform Mike, cancel the service on their part and send someone out to pick up the set-top box?

[...]

> Question: What's in the magical lump at the bottom of the radiator?
> Resistor?
>

The short review in Feb 2006 QST says:

> According to Comet, the matching circuit is basically a network of resistors and capacitors. A toroid balun is present as well.

It also says:

> The CHA-250B’s performance is mediocre to poor on 80, 40 and 30 meters, but it does an adequate job on the other bands. At a list price of $469, this is hardly an inexpensive antenna. Frankly, a small antenna tuner, a length of 450-Ù ladder line and a wire dipole will yield superior performance at less than half the price.

But:

> In circumstances where choices are extremely limited and cost isn’t a major consideration, the Comet CHA-250B may be a contender, especially if the alternative is not getting on the air at all. In addition, the CHA-250B may also be a viable option in emergencies when you need a multiband HF antenna that can be deployed in a matter of minutes. In those situations you just want to get a signal on the air, not work the world.

Bert Hyman W0RSB St. Paul, MN bert@iphouse.com
****
-
I'm somewhat skeptical of the claims at lower frequencies, particularly with my recent experiments with tuner loaded verticals.

The current experiment is a 14 foot long vertical (on a flat metal roof) fed with 25 feet of RG-8 and a tuner at the rig. It does work quite well on 20-10 meters, but not below 20 meters.

I saw a case of that twenty years ago in Key West, Florida. I suspect the
authorities had to look the other way because affordable technology to do it
better didn't exist. The Florida Keys were served out of a headend that was
close enough to the mainland to get decent OTA signals. however, by the
time those Miami signals got to Key West, they were pretty bad. I have no
idea how many amps were used. (IIRC, local origination channels were OK.)

I think five amps is about the limit due to added noise and cross-mod.

In practice, without serious and constant TLC, the length of cascades of
amplifiers is usually limited by the frequency response flatness (or
lack of it), and the ability to maintain it. I think that the maximum
I've been involved with was a cascade of about 20 normal trunk
amplifiers plus three or four distribution amps / line extenders on the
end. Thank heavens these days for optical.

The tuner for short antennas should be at the antenna. While it will not be
a real killer of a signal, many mobiles do very well with antennas about
half that long, but the antenna is usually loaded at it to match the
feedline.
If you put one of the screwdriver type antennas in the same spot, it shuold
make a lot of differance on the lower bands.

Not mentioned in my previous post is that there is a separate vertical 11
feet long, base loaded, for 40 and 30. I haven't really done much
experimentation with it yet.

I am interested in knowing more details about the Comet matching unit, but I
suspect that the details are unavailable.

Yep.. My mobile antenna in it's longest "parked" config is a 14 foot
tall whip, and the loading coil is at 8 or so feet up from the base.
It browns the food quite well on 80 and 40, mounted on my large Ford
truck.
The base of the antenna is on the side window pillar, about 2 feet
below the roof line.
I've parked on the beach "Gulf Coast" and done better on 1500+ mile
paths with 100w than some of the guys running dipoles and amps at
various home stations around the country.
No joke.. just due to my antenna spitting most of it's power at just
the right angle, where as theirs were largely aiming straight up in many
cases.
Anyway, the loading is the key.. If the 14 foot whip is loaded at the
antenna, and the radial system is good, it will work pretty well.
And as usual, it's better to have the coil center loaded or slightly
higher for best results. Or add a top hat/wires. But that may cause

visual issues for some. :|
But even base loading would work much better than tuning from the shack
with a tuner. On the low bands with a such a short whip, the tuner loss
will usually get you, even if the feeder losses are low.

No one has a 'right to' cable TV. I was at one meeting where a citizen was demanding that they revoke our franchise. They told him that one complaint out of 10,000 customers wasn't enough reason to revoke. he was as arrogant as you. Everything had to be his way. He got really pissed when they told him to buy a satellite dish and go away. His demand was a s ignorant as yours. He was demanding that he bring back CBS ARTS, and wouldn't listen that CBS had dropped the service. One other complaint was from a woman demanding that our franchise be pulled because CSPAN was down for a couple days during the modification of a 5 meter dish to multiple feeds.

> the set-top box?

Sigh. Just because there is a new agreement for the industry doesn't mean that all existing have to comply. Some companies are FIOS. By your standards, everything else should be replaced overnight. Then the distance won't matter at all. I doubt that the income from that marina will ever pay back the construction costs. the system worked for analog, when it was installed. There are no guarantees in life. Stop trying to walk on water, you'll drown.

From the beach at Port Aransas TX, I connected a 20m dipole to my 100W TS-120. The dipole was 9 feet up in the center (ladder on the motor home) and the ends were about 5 feet off the dirt. I worked three German stations in short order, along with a slew of guys in the northern US. (The Germans were contesting that weekend.)

You just never know what will work.

I wrote some notes at http://vk1od.net/antenna/misc/CHA250.htm .

The advice that it contains resistors is not supported by inspection of the device.

It is lossy, and loss is a common technique for broadbanding an antenna system.

If you Google, you should find plenty of pics of what is inside the base of the unit.

Owen

Yech...

Please try this test. Insert such a crimp type F connector and cable
into some useless piece of equipment with a type F jack. Pull on the
cable hard. In my experience, it doesn't take much to make the cable
and connector part ways. Repeat with a screw on connector. Now,

repeat the experiment using a properly assembled compression type F connector and cable. It takes considerably more brute force to break the connection. I think the official minimum pull test is 55 lbs, but I'm too lazy to Google for it now.

Hiding the workmanship under shrink tube is not very functional. It will have little effect on the pull test.

Most of the cable leakage problems I've seen (and found) were due to crimp type F connectors coming apart or badly crimped. That includes both the hex shaped crimp, and ones held together with a crimped ring.

Bad:
<http://www.fconnector.org/wp-content/uploads/2011/12/F-Connector2.jpg>

Worse:
<http://www.showmecables.com/images/catalog/product/F-connector-RG59.jpg.ashx?format=jpg>

Good:
<http://images.lowes.com/product/converted/783250/783250926510lg.jpg>

I tend to judge people by their willingness and abilities to learn new things. You fail.

You may know something about CATV and fiber, but it doesn't show. Instead of taking the time to educate those whom you suspect of being in error, you waste our time with insults and unsubstantiated opinions. Your command of profanity is truly impressive, but misplaced. If someone presented you with your comments, what you would think of the author?

I can't imagine what personal tragedy has occurred in your life, that you find it necessary to demonstrate your competence at the expense of others. If you're truly competent, such a crutch is not necessary. If you clean up your act, there may be hope for you remaining.

See above. Obviously others can. And yes, I have designed RF broadband
power amps. Lots of them. Not just lashing up boxes but the actual
transistor level circuitry including layout guidance for the nasty stuff.

Fact is, if a cable company isn't competent to do a 170ft drop they
should decline the job. Otherwise it is a screw-up, plain and simple. In
our area they'd lose their shirts to the satellite guys because there
are many houses like ours where there is no reasonable way to get from
the street to the house with a 100ft limit. We have around 200ft that's
still there from the early 90's and the previous owner said cable TV
worked just fine for them. We are not subscribed because TV ain't that
important to us.

He really needs to create a new file from which to cut and paste. Like
most comedians', his jokes get stale after awhile.

He mentioned running 400 megabuck projects.  With his attitude he
wouldn't last 10 seconds in the interview for a position like that.  And
if he by chance made it through he'd be gone the first day because of
performance and trouble getting along with anyone.

He does sound like someone who does do janitorial work, now that you
mention it, and is trying to compensate for his lack of success and low
IQ with insults.

Usenet.  You gotta love the kooks.

Still easier than having to use blasting caps to find the ends of a broken conduit under the finished concrete floor in a new RADAR site. An old fish tape & blasting cap pushed as far as it would go and BOOM!!!. Then repeat for the other end. Then they used a jackhammer to break out the concrete between the huge floor divots to install new conduit. The electrical contractor had failed to tie the conduit to the rebar & wire mesh before the pour. :)

Or driving ground rods through permafrost in Alaska. We drove 60' of rod and used three tanks of Acetylene to heat the rod to get it through the ice layer outside a military radio & TV station at Ft. Greely.

Yawn. You constantly harp about having to meet specs in medical, but whine like a drunken jackass when other businesses have to meet their specs. yes, they could design the sytems to 300 feet or more, but the cost to every customer on the system would go up. Would you like to pay

an extra 20% to 30% just so a very few locations can get better
service? Oh, that's right. You're too cheap to even have cable TV.

You've got me beat.

I am glad I didn't have to use blasting caps as TDR. But it does sound
kind of fun if you didn't have delivery pressure on top of it.

Sounds like good work. But not up the Giant Rat's standards, I'm sure.

Interesting that he portrays himself as young and uses that reference.
Very curious. Maybe he's old and a failure and not young and a failure
as he claims.

Those were the lowest grade, next to screw on fittings. They had the highest leakage, and shortest service life of all the connectors I ever tested. Did I mention that we bought 50,000 feet of RG-59 & RG-6 per month for cable installs? We were using the Raychem for new work & repairs in the mid '80s. They were the best we could find, both for drop, trunk & feeders. They didn't need a boot, and you would break the cable before a connector would pull off, if installed properly. We had to keep a close eye on radiation to prevent one of the midband channels from interfering with airplanes. 95% of the problems were those half assed separate ring, three cent connectors.

He was a cable grunt when Time Warner built Cube in Cincinnati, so I'd
say that he's at least 50 and still a very angry failure.

That RADAR site was at Ft. Rucker, and the problem was in the area
reserved for the new IFF hardware in the mid '70s. Weathervision was
assigned to the space while I was there, but were were in the process of
moving to another building when I was told I had orders for Vietnam. I
ended up in Alaska instead. Two weeks later that AFRTS station in
Vietnam was overrun and the engineers killed. They shipped parts of the
transmitter that survived the gunfire to the station in Alaska. :(

```

It's the same as the Cisco Explorer 1540C with some features removed
by Comcast.
<http://www.cincinnatibell.com/shared_content/pdf/tv/exp1540_uguide.pdf>

How to get into the diagnostics:
  Press and hold SELECT on front of unit until the MAIL light
  starts to flash, then press INFO.
Or
  Press and hold PAUSE on remote until MAIL light starts to
  flash (around 10-15 seconds), then press PAGE-UP (-).
  On some remotes, PAGE (+) might need to be used instead.

I'll guess(tm) that TDC is downstream power, and RDC is upstream
power. (20MHz is in the frequency range used by upstream path).
30dBmV is acceptable as the upper limit is about 55dBmv. Remember,
this is dB's above 1mv into 75 ohms, not dB's above 1mw into 50 ohms.
dBm = dBmV - 48dB
So, your 30dBmv is really -18dBm

The downstream values are also in the ballpark. See:
<http://www.dslreports.com/faq/16085>
The numbers are for cable modems, but the levels should be similar for
DTV. The typical delivered values should be:
  -10 dBmV to +10 dBmV "Recommended".
  -11 dBmV to -14 dBmv / +11 dBmV to +14 dBmV "Acceptable".
  -15 dBmV & +15 dBmV "Maximum".

5dBmV is fairly is good enough and should result in a usable picture.

See if you can excavate the SNR numbers. Maybe there's RF garbage on
the systems (oscillating distribution amp, ingress, whatever, etc).

Sorry to hear that. Had friends that survived intact but were still
damaged goods from that war.

Unfortunately the traffic has nothing to do with antennas.

Things dried up here around 6 months ago. I suspect the people with brains and stories, and some of us remember who they are, are no longer with us or finally bailed due to the noise.

Now all there seems to be is some less verbose hangers on plus script kiddie morons and worse.

I missed that. Probably because I ignore the worst of the BS.

Where did he mention being a Linux wanabee (that all he could be given
what I've heard from him; at best a script kiddie)?

  List the "new things" you or any other fucktard here has ever tried to
instruct me on. Oh... THAT'S RIGHT... YOU CANNOT. You and your petty
jack-offs are total failures.

> You fail.

  I am fine. You are an idiot who think he can make a valid assessment
based on some other dumbfucktard's stupid remarks, taking them as if they
are factual. You are even more pathetic than the retarded bastard who
spouted the lies to begin with.

>You may know something about CATV and fiber,

I know a lot about a lot of things. For you to assess the level of my skills or knowledge based on the stupid horseshit some lame fucktard spewed in this thread, is more of a tell about your inability than it is about my abilities.

> but it doesn't show.

You're an idiot. Half the fucktards in here don't even know what Digicipher II is, and you likely don't have much of a grasp of it either, fuckhead.

>Instead of taking the time to educate those whom you suspect of being
>in error,

WTF are you attempting to do here, asswipe?

> you waste our time with insults and unsubstantiated
>opinions.

You are an idiot. The insults go to assholes who have been haranguing me for years. Every now and then, some completely uniformed retard like you comes in and makes a stupid assessment based on a single thread.

You are so fucking stupid, you probably believe the retarded fucks claiming I am a janitor. IF I were a janitor, 98% of you fucktards would be in a landfill by now.

> Your command of profanity is truly impressive,

You are a goddamned idiot to make any assessment about it at all, dumbfuck.

> but
>misplaced.

That is an opinion. Just like mine that you are about as stupid as it gets, because you are not informed enough to know what has been taking place for years here. Fuck you and your horse blinders, dumbfuck.

> If someone presented you with your comments, what you
>would think of the author?

When I was presented with insults years ago, I returned the favor. The immature retards have yet to stop being the total fucking retards that they are, so I will continue pointing out their utter stupidity to them, and dumbfucks like you. You are just too fucking stupid to see it for what it is. The Pommy Retard has ALWAYS stalked my posts, and made stupid remarks, and you are jumping on me for calling him the total piece of shit that he is?

You are dumber than dogshit, boy!

>I can't imagine what personal tragedy has occurred in your life,

Idiots like you. That's what happened.

> that
>you find it necessary to demonstrate your competence

You have no clue as to my competence in any field or endeavor, you stupid fuck. The fact that you use a Usenet post to form your pathetic assessment says more about your immature stupidity than anything about me. When will you realize that your fucking guesses about someone have no basis in reality?

> at the expense of
>others.

I would charge you your entire life if I could. Many of you should be cleared from the gene pool.

> If you're truly competent,

Make up your mind, FUCKHEAD. You are either on the make shit up about me bandwagon or you are not. Either way, you have already stepped over the line.

Such opinions about what my motives are, are truly more stupid than the pother idiots and their petty bullshit jabs.

> If
>you clean up your act,

I do not have to measure up to your pathetic, unqualified, unprofessional, unsolicited retarded assessments, IDIOT!

> there may be hope for you remaining.

If you were here, there might be hope for you to eat without a straw after I turned your fucking jaw sideways. You are pathetic.

Go judge your mother, fuckhead. She is a criminal bitch for not flushing you the moment the retarded slut shat your retarded ass.

I especially love how he uses the word "professional". Surrounded on both sides by profanity, He works for no one.

Oh how he wishes. :)

It wasn't a joke, fuckhead. Your mother should be put in prison!

And I have NEVER cut-and-pasted anything in my life in Usenet, you fucking retard.

I sit here and type. You got that, boy? You retarded fuck!

If you are so talented that your employers don't care what you say then
tell us who you work for.

You are so much more talented than all of us here and you are so
valuable to your current employer that there should be no problem
admitting who you are and who you work for.

They probably don't care a bit that you swear (very poorly) at everyone
that responds to you.

So fess up mister big cojones, who do you work for?

My bet is no one that counts.

And you have no cojones.  None at all.

Respectfully, Michael even though we wouldn't *want* to make a 170 foot drop. it isn't unheard of. And the amplifiers are very capable of handling it. Ind it is very location specific. Getting a decent signal at a marginal location doesn't have any effect on the rest of the system. There are attenuators and there are equalized attenuators that will give a flat signal at the end of a 170 foot drop.

RG6 cable has a loss of around 5 db per 100 feet at 500 MHz. Let's give you 10 db at 170 feet, worst case. When I worked in the industry, I plugged (or designed in) in a number of equalized attenuators. It only affected a single drop, or some times a few. You could have a specific amp running about +10db, and with the equalized attenuator, hit the house around 0, flat.

While some might think that it is bad design, ask the system owners whether they would want to put in another pole, perhaps with a distribution amp, or simply use a 20 dollar attenuator.

The world is not perfect, and my job in the catv world included just about every part, from strand mapping to system layout to in the field work. We needed a balance between perfect and affordable. But the only time there might be an issue was if the system was over-amped, then there could be problems with proof of performance certification. We never had an issue with that.

Bottom line is, a 170 foot drop is perfectly capable of having a nice flat swept signal - and it should, unless the system design itself was bad. Done properly, any issues will be mechanical rather than electrical. But nowadays they have messengered cable, so it's even less likely.

 I was playing with Moonrakers way back in the early seventies.

 I was reading the CRC handbook at 11 yo.

 I was working with fractals before you even knew what they were.
```

I was playing with Moonrakers way back in the early seventies at 15 yo.

Now, IF you know what that simple piece of gear is, you might start to get a clue. As it stands, you are worse than a modern day stigmatic pig from LA.

You know NOTHING about me, you stupid fuck. WAKE THE FUCK UP, BOY!

 That I am.  And I am going to stay that way too, idiot.

> that there should be no problem
>admitting who you are and who you work for.
```

I will. In person only, and you have to give your info first. Feeling paranoid yet? That's right, asshole. I would use the info to make the meeting less savoury than you expect. You would end up in the sewer, where you belong, and where your mind already is.

Are you seeing the reason why Usenet is anon yet, dumbfuck?

40 lbs outdoors, 30 lbs indoors.

<http://www.scte.org/documents/pdf/standards/SCTE_124_2011.pdf>
6.2.2
  Axial Pull Force: The male �F� pin type connector, when
  attached to cables manufactured to SCTE approved standards,
  shall withstand a minimum axial pull force of 40 lbs for
  outdoor and 30 lbs for indoor applications when tested
  per ANSI/SCTE 99 2009, Test Method For Axial Pull
  Connector/Drop Cable.

I doubt that the crimp connectors could pass the test.

 You did not put forth any effort, you lying piece of shit.  You had no
intention of putting forth any effort either, you lying piece of shit.
You are no different than the other asswipes, or you would have jumped on
them when their insults flew years ago. But YOU are OBLIVIOUS, boy.

  You are just like all the "intelligent" cops out there.  Where are the
ones complaining about the fact that Tasers are NOT non-lethal?  Oh...
that's right...  the retarded fucks would NEVER declare that their fucked
in the head brethren could possibly be doing anything wrong!

  Tasers should be banned completely.  Assholes like you need to get a
clue, because the behavior of the idiots I deride are who you should be
going after, boy.  So, essentially, you are nothing more than just
another one of them.  And THAT is RETARDED.  The term is NOT just for
congenital defects, idiot.  Dumbfucks like you, who would be otherwise
intelligent, become SELF retarded when you take steps back from your
intelligence. That is what you are doing here.  That is what they did.
That is why they are retarded.  That is why YOU are retarded. The term
has NEBER been about sad, dumb fuckers who got a raw deal at birth.  It
has ALWAYS been about how you otherwise claim to be intelligent asswipes
act like fucking ten year olds here.  THAT IS RETARDED! You dig, boy?

   They go to two other outlets, that are used for transient boaters.
sometimes they are used and sometimes they sit unterminated.
  I have not seen my problem better or worse when boats are in or out.
But I have several 75 ohm F connector terminations. It's worth a try.
                            Mikek

I'm sorry I got that wrong, they are F compression connectors.
Coax was from the cable company.

My drivel:

At my home, knology recently upgraded there system for faster internet.
A cableman said he heard me radiating a block away. he came in and
changed 7 crimp type connectors in my attic a couple of cable runs.
Speedtest.com went from 6 Mbps to over 11 Mbps with just those changes.

Just an addition to the termination debate, the marina has about 150 taps, I'd be surprised if 30 of them are connected to a tv and the rest are unterminated. The line generally goes to the utility pedestal into a 2 way splitter and then about 1 ft of cable connects it to the 2 taps for the boat owners.

Mikek

Yup, try it. Transient boaters will most likely not carry the required
set top box around but use the lower analog channels or nowadays maybe
UHF digital. Sort of "basic cable". Then the TV is connected directly
and those rarely have a true 75ohms input.

Yep, that's the way it works. Compression type F connectors work well. Crimp type are junk. The catch is that there are probably 100 different types of connectors, each with their own compression tools, intended to fit about 8 different types of 75 ohm coax (RG6a/u, RG59/u, single shielded, double shielded, quad shielded, direct burial, etc). Mixing connector types and cables doesn't work. I got fed up and "obtained" a 1000ft roll of double shielded RG6a/u, a big of matching F, BNC, and phono connectors, a compression tool, a stripping tool, and replaced all the junk cables in the house.

I'm sure it's true for Comcast in Santa Cruz, CA. No clue on other
areas. The grand plan is to move all the analog channels to digital
area by area:
<http://www2.insidenova.com/news/2011/jun/22/comcast-removes-scores-channels-analog-cable-ar-1126652/>
<http://www2.newsadvance.com/business/2011/nov/09/comcast-switching-analog-digital-ar-1448489/>
Unfortunately, your area may be one of those that have moved to all
digital. Hard to tell from here.

>   Mikek

Can you determine if the marina is using a distribution amplifier
driving a big splitter, or is using a single cable trunk snaked
through the marina, with taps (directional couplers) at various
points? If taps, it's easy to install too many taps, or miscalculate
the tap type, resulting in level variations along the trunk.
<http://www.doityourself.com/forum/entertainment-center-tvs-stereos-vcrs-dvds-8-track-tape-players/334706-difference-between-tap-splitter.html>

Oops. All my mentions of dBm should be dBmV. Thanks.

Range of acceptable signal levels. They're similar for DTV.

Google your cable box model. You should able to find ifo on how to
pull up a menu that shows signal strengh. -60dbm is about where my
sigal starts droping out

Jimmie

   Not really.  If there are long unterminated 75 ohm cables after the
splitter, they are a crude termination.  The splitter's backmatch
eliminates ghosting from reflections from the unterminated end.

Those are 'Equalizers' and used to cancel the cable losses. There is some adjustment in the trunk amplifiers, but some brands just used a plug in equalizer marked with the rolloff in dB while others had both. The coarse plugin, and a variable equalizer to level the trunkline for 'Proof of Performance' tests.

   In your opinion.  If they are delivering the level called for in
their franchise, they didn't screw up.  It has always been up to the
customer to pay for or provide extra equipment for non standard
installs.

  A power inserter is used to put 9-28 volts DC on the coax, depending
on the amplifer you use.

Google your cable box model. You should able to find ifo on how to
pull up a menu that shows signal strengh. -60dbm is about where my
sigal starts droping out

Jimmie

===

Yes, but be mindful of the difference between dBm and dBmV.   The cable
industry often deals in levels on the dBmV scale.

There are places like this ...

http://www.maxim-ic.com/app-notes/index.mvp/id/808 where you can see some conversion equations. Jimmie's -60dBm equals -11.25 dBmV. Same power level -- different scale.

I have long known level requirements for the TV tuner's cousin, the cable modem. The common DOCSIS 2 cable modems are usually spec'ed for -15dBmV to +15dBmV and the smart operators try to keep inside +/- 12. Thus, you can see that Jimmie's -11.25dBmV is near the low limit and that dropouts become more likely in that neighborhood.

I little bit of google snooping revealed that DTV cable boxes would like 0dBmV and will usually be okay with -10dBmV to +10dBmV. Almost the same.

i hope this helps.

If their company cable box doesn't deliver a useful and reliable signal
I call that screwed up. One pays for a service and expects to either get
it delivered as promised or money back.

>                ...  If they are delivering the level called for in

Mike's install does not sound non-standard. 170ft cable drop towards
premises which is fairly normal, plus the cable company's set-top box.

  I was fine you fucking retard.  Learn to read.  My remarks were about
the fucktards all around me, not myself.  I actually learned about what
things one does NOT do as a cable installer, and cutting corners on
policy was high on the list.

  Makes me wonder why anyone would have ever paid a retarded presumptuous
asswipe like you, if you cannot even read a simple Usenet post.

Interesting how little you bother to learn about the people you swear
at.  At least I can put a sentence together.

And I was leading 10M$ engineering projects while you were installing cable.

There is nothing you can spout that would denigrate me.

  Grow up. That is an excessive length drop. A standard drop is under
100 feet. You think you know everything, and that the world has to live
by your rules. You don't, and it doesn't. I'll bet you've never even
seen a CATV franchise, or the dozen of pages of specifications agreed to
by both the CATV company and the local government. The CATV company
isn't a Santa Clause machine, and local governments know why there are
limits to the service provided. If there were't, no one could afford to
build or operate a CATV system. You've never designed a headend, or a
physical plant If they build to supply higher port levels, it has to

start at the headend, and requires closer spaced trunk amplifers. The system noise goes up from all of the cascaded amplifers, and the equipment runs hotter, withj a very reduced service life. When you can design an RF distribution system of more than 500 MHz bandwidth and has over 10,000 output ports, with the gain stabilized to a couple dBmv 20 miles from the headend and over a range from sub zero F to + 100 F then you can tell me I'm wrong.

One headend I designed and built was only off by .1 dBmv at the test port on the first trunk amp which was a half mile from the head end. If you can do better than that, I'll listen to you and your opinions

--
You can't have a sense of humor, if you have no sense.

Cool! You seem to know what you are up to.

Can you put rough numbers around what you mentioned? Like what are
providers legally required to deliver at the far end of the drop?

Thanks.

tom

We were required to deliver 0 dBmv at the end of 100 feet of RG-59 or RG-6 for two sets per the franchise. The system was designed at +10 dBmv at the tap to allow for three or four TVs at the 100 foot range. That was on a 36 channel system with RCA modulators & HST. It was done for two reasons. To have a little extra signal available when the system was built, and for conversion for a 300 MHz plant to a 450 MHz plant without respacing the trunk amplifiers.

I build a headend & interface to tie two incompatible community loops together. Ours was a sub split loop, and the other CATV company used mid split. We used 2 & 12 for pilots, so we fed them Channel 2 into their return, and down converted their feed to T-9 for our return. That headend had two RCA HSP and a combiner. The interface was another HSP in a large stainless steel NEMA box mounted to a power pole at the boundary of the two systems. A pair of two way splitters were used to route the signals between the systems, as well as into and out of the HSP. The other company wanted us to install a modulator and a demodulator at the boundary to give us audio & video, and another pair from our side so the interface would be baseband. Their design was over $15,000 in hardware alone. My design was under $3000 for all the hardware & labor to install. I had system designers from both sides telling me it wouldn't work, but it did the job with no problems. :)

>And I was leading 10M$ engineering projects while you were installing cable.

Yes, and now I am leading $400M (yes, idiot, the dollar sign goes in front) telecom projects which include spaceborne elements and the fastest gateways on the planet and put Americans to work all over the nation in support, and you get to type stupid shit in Usenet and on your facebook facetard account and wither away like the old, dead fuck you are.

Soon enough, you'll be as senile as krw is and you won't even be able to cut a cable fitting, and I will be still taking cross country tours and racing on my bike and barefoot water skiing and living until 2110. Hell, I'll set records. I am just getting started.

Yes, idiot... you are amusing, sometimes. Bwuahahahahahaha!

Very nice. We were much more constrained on the install I mentioned up
the thread a ways. The fiber was fed at E1 speed, which probably didn't
work it very hard.

We had an issue at one point.

This was a distributed proc/data system, one of the first. Each cabinet
was a standalone PBX. And you could make 126 of them look like one.
And each could survive on its own.

First fiber campus we'd done. Staggered cut to the new infrastructure.

Fun stuff.

At one point we had to do the cutover to the other large pice of the system. Each end connected the fiber. 0 signal.

TDR from A end showed 700 meters from A end, 800 meters from end B.
Length from A to B is 1500 meters.

The work that occurred because of that was not fun. Had to go get the guy doing fusion splicing.

Joy. Midnight trip to Pittsburgh with the salesman.

Actually it was fun. Not much traffic at night.

Landing pattern at 160mph in between DC9s into Pittsburgh at about midnight. And they didn't like 160 at all. This was scary.

Quickest turnoff onto a taxiway I've ever experienced. Of course the taxiway may not have been one. We didn't care.

  Yes, and the fiber was obsolete within a few years after installation,
and is not compatible with the standardized cabling and I/O methodology
in use today.  Even modern copper Ethernet is faster than that 20 year
old 100Mb/s obsolete fiber and that number was before the overhead.

  Whoopie doo, the ditz knows how to polish a face.  Not even required
any more.

Wikipedia is also handy for things you know nothing about!

What's Ku got to do with anything. I was designing and using Ku TWTAs
over twenty years ago. I was system engineering director for several
military satellites systems, including those for the UK and NATO. These
did not use Ku because of the problem with rain attenuation.

P.S. How about a reply using one of the many Linux systems you mention?

  Yes.  So people like you can give a cursory glance to a given term or
subject.

  As for me, the things I mentioned are things I *do* know something
about.

  Sorry, you fail.  Just like the others.  This group is full of dopes
like you, who know nothing about people, and even less about the world.

Good for you. Now, you are an old, jack brained fucktard who jumped on the s.e.d jack brained fucktard bandwagon, and*I* am working with modern, advanced ku systems.

> I was system engineering director for several
>military satellites systems,

And now you are a withering old fuck who comes in here mouthing petty horseshit about someone as if you know them, when you, in fact, have no clue about anything about them. What you are doing is jumping on the petty, immature asshole bandwagon. You are a special case type asswipe.

> including those for the UK and NATO.

Oh boy! Mine are mobile! You're a joke!

> These
>did not use Ku because of the problem with rain attenuation.

Not as bad as other bands and worse than some others. Easy enough to get around.

>P.S. How about a reply using one of the many Linux systems you mention?

WTF does Linux have to do with any fucking thing, and why would I go out of my way to do a goddamned thing for a mouthy punk fuck like you?

Then, there is the fact that I could be running this very "agent" session from within a DOS vdm from within a Linux base session, and a dopey fuck like you wouldn't know the difference and couldn't tell the difference.

Sal, A relative number by any other name would smell as sweet. The
reccomendations for my box is about the same but it works well below
that at least according to what I measure withe the cable box. BTW it
just says 'db'. dBm was an assumption on my part..

Jeff, I installed TVRO systems for several years and used a lot of F
connectors. Suprisingly the ones I found that worked best were the
ultra cheap ones that only took a pair of pliers to fasten  These were
the ones with the separate crimp rings. Used with some good quality
heat shrink tubing this eliminated most of the problems you mention. I
dont know why these connectors went away, my only guess is  that
someone wasn't making enough money on them.

I can help a little. I had an AEA Isopole for 220 donated to the club or me to resell it. I tested it first to authenticate its value. The upper radiator on the 220 model appeared to just be an aluminum shaft.

http://www.isopole.com/imagenes/PDF/144e.pdf maay help.

As I recall, there is straight DC continuity to the upper element from the center of the coaxial cable. Don't know if there's a coil involved.

While I am not acquainted with the design theory, I suspect that the cones on the shaft decouple the bottom element at some discrete electrical length. Others may know.

Good luck.

73,
"Sal"

>
> Jimmie

In theory I would think it should work. But I'm not sure of
the values used for the matching section in the original whip.
It shouldn't really be that critical, but it is a dual 5/8 collinear
rather than a 5/8 ground plane. I don't know if that changes things
matching wise or not. IE: are they matching only the upper element, or
both? I'm not sure.. :/
Remember that the upper cone is part of the lower 5/8 element, and
it's overall length including the mast tip above it should be equal to
the upper 5/8 whip. In the original, both the upper and lower elements
were appx 50 inches each, or appx 100 inches total, which does not
count the lower decoupling cone.

Summary: Recruitment announcement for ham-radio-related FAQ articles
Keywords: FAQ, Intro, amateur, ham, radio, recruit, recruitment

Posted-By: auto-faq 3.3.2 beta (PGPMoose V2.0, Perl 5.005)
Archive-name: radio/ham-radio/recruitment
Revision: 1.2 2009/11/25 14:41:01
Posting-Frequency: posted monthly
URL: http://www.faqs.org/faqs/radio/personal-intro/

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been recently revived by an active moderation team. We are currently seeking suitable information, FAQ, and bulletin articles from the entire rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our newsgroup.

We are seeking a replacement maintainer for the following information bulletin formerly posted to rec.radio.amateur.* (and currently archived at http://www.faqs.org/faqs/radio/personal-intro/):

radio/personal-intro
Subject: Guide to the rec.radio Newsgroups
Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
Last Posted: 9 Nov 2001 06:18:17 GMT
Posting-Frequency: 15th of each month

```
One significant omission, requiring immediate updates, for this article      |
is that it does not mention newer amateur radio newsgroups created since     |
it was written, including:                                                   |

 rec.radio.amateur.antenna                                                   |
 rec.radio.amateur.boatanchors                                               |
 rec.radio.amateur.dx                                                        |
 rec.radio.amateur.equipment                                                 |
 rec.radio.amateur.homebrew                                                  |
 rec.radio.amateur.moderated                                                 |
 rec.radio.amateur.space                                                     |
```

We are willing to provide any technical support necessary to get this article updated and automatically posted again at a regular interval. This would include establishing contact with the original maintainer for any necessary permissions. We would prefer to seek a new, dedicated maintainer at this time, rather than start auto-posting the original article ourselves.

For more information about our newsgroup, see:

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to

rec-radio-info-request@panix.com.

I found one matching schematic at this site..
Seems it's a fairly conventional L/C circuit.
The diagram was in the "Facts About Vertical Antennas" file.

Hi All,
I'm on a boat, about 170ft from the utility post.
Recently our cable company switched to the wonderful world of Digital TV. I got the new digital converter and had no picture.
I took the box back and got a second box, still no picture. So now I suspect a weak signal and confirm that it is the cable length. The cable company came out and gave me a better cable than I had installed. At this point I have a picture but it is intermittent. The signal at the utility post has 3 outputs and had a four way splitter, I suggested the cable guy put in two 2 way splitters and give me the stronger (first) tap.
That got my signal to work almost all the time. I'd like to get the signal to work 100% of the time.
I don't has access to electricity at the utility post, so an amp is out. Although I could try an amp at the cable box end. Is that reasonable?
I would run two cables if there was a way to make it increase signal strength.
Getting anymore from the cable company is not an option.
Any ideas to get a better signal?
Mikek

PS.

When the signal fails it seems channel 41 is ok and above 42 it breaks up.
Curious to know if there is an unusual frequency jump between those two

digital channels.

Despite your long 170ft drop cable, were you getting good analogue signals before the change to digital? If so, it could be that something is not right. Normally, even if you have had only fairly mediocre analogues, the digitals are good.

Otherwise....
It sounds like your signals are just too weak. As things are, and if you can, the obvious fix would be to overcome the substantial loss of the 170ft drop cable by fitting an amplifier at or near the utility post (not at your end), and power it with low voltage via the coax from your end (ie similar to a line-powered masthead antenna amplifier). However, you would need to consult with the cable company to see if they were OK with letting you do this. It could be that they might be able advise you on the most suitable amplifier to use. It's not rocket science, but you have to be a little careful not to break any of their rules and generally do anything they don't approve of.
--
Ian

 That's about 10dB loss at midband for RG6.

That was just a 3dB boost.

Really? There are such things a power inserters and compatible drop
amps that allow you to power the amplifier over the cable from the
user end. For RG6 18ga stranded that is about 0.6V loss at 250mA and
therefore doable,

Use a 15dB gain drop amp with power inserter, but that's just a guess.
Would help if you actually knew signal levels like what the receiver
requires for optimum reception and what the cable co sources. Putting
the amplifier at source gives you a typical system noise figure of
3dB, but putting it at your end limits your NF to 10dB minimum from
the start.

Adding an amp at the cable box isn't all that likely to work... you can try it, but don't get your hopes up. Unless the amp has a significantly lower "noise figure" than the RF front end in the cable box, all you'll be doing is adding noise... the desired signal will be stronger, but the noise will be stronger yet.

Something you could do, is add a single-port RF amplifier right at the utility post splitter, where your tap comes off of the feed. You can buy amplifiers of this sort which are designed to receive "phantom power" through the coax cable... you'd install a "power injector" at your boat, which feeds a DC voltage up the coax to the amplifier. This is probably your best bet:

- It would amplify the signal before it's attenuated by the 170-foot cable run.

- It won't require a power supply at the post... just at your boat, where you already have power.

- It shouldn't interfere with the other taps on the splitter, even when the amplifier is not receiving power from your boat.

You'd be looking for an "antenna mast" type of preamplifier. The Channel Master 0068DSB or 7777, Winegard AP-8700 or AP-8275 or HDP-269, AntennaCraft 10G212, or one of the Blonder Tongue Galaxy III models might do the job for you. You'll probably want a "75 ohm in, 75 ohm out" model, which would connect directly to the 75-ohm coax.

see URL:
<http://www.dbsinstall.com/broadcast/vhf_uhf_freq_list.asp>
41 is 324 - 330MHz and 42 is 330-336 MHz
cables attenuate more at higher frequency.

By ALL means, if you're going to add an amplifier, add it at the
source location, not at the receiver location
Cheap, but good, ones are available from microcircuits. Can you buy a
line driver from your CATV company?

I suspect the 'better' cable is only marginally better. What is the
EXACT cable you're using? what is its attenuation per foot per MHz?
You can buy extremely low loss coax, but you may have to send in your
first born. Go to a local NRTL [EMC Test Lab] and see if they can
(are willing to) order a length for you.

Find the highest channel you wish to receive and the frequency
associated with that. Now you can balance the amplifier gain with the
cable loss to determine if it will work. Note you already know that
170 ft of ?? cable gets you up to channel 41, so from that number you
can estimate just how much drop your receiver can take before it stops
receiving.

Are you sure it's a signal strength problem?
The cable guy should have been able to measure the signal at your cable box.
Are the people using the other taps having problems?
If you're on a boat, you might be at the end of the cable run.
In that case, you might be able to get them to crank up the gain in their
distribution amp.
Power at the pole is not a problem. You can get amps that are powered
through the signal cable to your cable box. Getting them to let you
install it
is another matter.
You can get MUCH better wire, for a price.

Signal strength is not the only problem with digital TV.
Reflections in the system can confuse the decoder. Are there
any unterminated cables on the other taps?

I have OTA antenna digital TV. Plenty of signal, but reflections
cause significant drop outs on some channels. More signal won't fix
that. In fact, I have a variable attenuator to REDUCE signal strength.
I tweak the signal level for fewest dropouts.

Might be electrical noise coupled in thru the ground system.

Bottom line is that you pay the cable company for TV reception.
It's their responsibility to provide you with a watchable signal.
You shouldn't have to tell them what to do. They should just FIX it!!

You are quite correct. However, digital is generally capable of working
to lower signal levels than analogue. It's amazing how rubbishy digital
signals can be, yet still give perfect pictures - but don't expect
miracles!

I see that several others have also suggested a coax-powered amplifier.
[If the cable company can't give you more signal level, it's the only
solution.] As suggested, they should be able to provide a suitable
amplifier and power unit - or at least advise you what to use.

Hey thanks for the part numbers, I'll look into these.
Mikek

The cable company probably has amplifiers that can be powered over the
cable run. If not, those amps can be found on ebay. Be sure to get a
bidirectional amplifier because some systems send the control signals
back up the cable to the cable company (Comcast in the southeastern
US, for example.)

John

That's helpful. however, I do receive channels up to 484!
Dang, just noticed "Lesbo Euro Trash: Big Boobs" is on 502, but, it's
pay per view. :-)

> 41 is 324 - 330MHz and 42 is 330-336 MHz
> cables attenuate more at higher frequency.

I thought there might be a bigger jump between 41 and 42
because when 42 was pixelating 41 was always perfect.

```
   I think I'll try the amp, before spending for better cable.

I think I just found a work around, The station I wanted, 42
is repeated on 428 in HD and it doesn't pixelate when 42 does.
  The pixelating problem is rare, only a spall percentage of the time,
but very annoying. Ah, the wonderful world if Digital TV.
                 Mikek

Yes, it is the loss in the cable.

> The cable guy should have been able to measure the signal at your cable
> box.

No other problems, I'm just way down the dock from them.

Yes that is possible, There are transients in and out so sometimes the
taps are used and sometimes not. I suppose I could make a bunch of 75
ohm terminations, and put on a new one every time it's needed.
However I never noticed a correlation between boats in and boats out.

> I have OTA antenna digital TV. Plenty of signal, but reflections

Ya, but no. It's in a marina and the marina has a deal with the cable company.
At this point there is talk about putting up an antenna.
The marina has ten cable boxes for transients that need to be plugged in and connected (I guess keep them updated). So it has become a hassle for the marina handle the boxes. I just want to lay low and not rock the boat.

At only 170 feet, that should not be a problem.  My cable runs down a
utility post, then over 200 feet to my house.  It  goes to a 2 way spitter
and then about 30 feet to a cable modem.  The other end goes to anotehr two
way splitter, one side to a regular TV and the other to a digital box.

No problem with the TV signal at my house, and the internet is around 7 MB
or however they measuer it.   That is by my test on the internet and what
they say I am paying for in the speed./

Sounds like they need to send more signal from the main cable to the taps to
your line.

FWIW, our local cable system just converterd to digital and after

installing the cable boxes I noticed that there were usually about 4-6 drop-outs between 6PM and 11PM. I suspected that the problem was at their end but they sent out a tech who re-terminated the cables at the demarcation box outside then changed that splitter from 3 output to 2 output. Inside he trimmed about 2m of excess cable from the wall jack [inside the wall space] and re-terminated that and installed a new jumper from there to a splitter [replaced] feeding the two cable boxes, one feeding the TV the other the VCR. He then measured the levels and the incoming signal was -10dB [just on nominal] and the back feed level [at the cable office] was -15dB, again just on nominal. He said that performance was good down to at least -20dB incoming. My run is about the same length as yours from the distribution pedistal and is of lower performance that RG-6.
The number of drop-outs is perhaps slightly less, but a new PVR seems to handle the drop-outs much better than the cable boxes did so they are less noticable than before. I have also noted that one particular commercial has a drop-out in it and it is the same everytime it is run, again pointing to the problem being at their end.

Ok, 200ft of coax. Presumably RG6a/u.

>Recently our cable company switched to the wonderful world of
>Digital TV.

You have been assimilated. Resistance is futile.

>I got the new digital converter and had no picture.

Something is wrong. The nominal signal from the cable drop is suppose to be 0dBm. If there's a splitter involved, they like to crank it up to about 10dBm. Your 200ft of RG6a/u will drop the signal from between 4dB at the low end, to about 6dB at the high end. Your set top box is suppose to operate with a 10dB margin. If you would kindly disclose the maker and model, it might be possible to find the specs. Typically, you'll have at least 10dB margin. Even with 200ft of coax, you should have 4 to 6dB margin.

Drag your cable box and TV over to the splitter and try it on the incoming drop. If that works, move to the ports on the splitter. Make sure that the unused ports are terminated properly. If that doesn't work, call your unfriendly cable company and ask them why they don't have sufficient level to operate your set top box without the 200ft cable. If it does work, find a 200ft RG6a/u cable that isn't saturated with water. Try to get some compressing fittings instead of the crappy crimp type.

Your unspecified cable set top box may also have some user accessible diagnostics which include per channel signal levels. You may want to check those.

I'm not familiar with Knology, but I suspect they do the same thing as Comcast. With Comcast, the lower 72 channels are still analog in my area. If so, you can probably plug your TV directly into the cable, set the TV for cable frequencies, not broadcast, and see if that still plays.

Hint: Troubleshoot by substitution.

Drivel: I spent about an hour troubleshooting my TV distribution system, only to find a brand new Type F "barrel" connector, with no center connections. That which is most obviously correct, beyond any need of checking, is usually the problem.

I take respectful exception to that last sentence. My digital cable box is about 130 cable-feet from the pole. My signal is tapped enroute for digital

telephone, tapped enroute for Internet and then split (by me) so I can feed
analog signals via a disttribution amp serving bedrooms, kitchen and shack.
I get enough from the pole tap to do the job.

Somebody is treating you badly -- maybe the cable company, maybe the marina.
Yes, the approach for you to buy and install an inline, remote-power amp at
the pole is entirely valid, technically. However, that's not in keeping
with reasonable expectations. You needn't roll over so easily. It's
supposed to work.

What -- Are you worried you might offend somebody? That "somebody" seems
quite okay with kicking you in the ankle. Or elsewhere.

wrote:

>Your 200ft of RG6a/u will drop the signal from
>between 4dB at the low end, to about 6dB at the high end.

Some better numbers for RG6a/u:

Freq MHz	Atten -dB
10	0.8
50	1.4
100	2.9
200	4.3
400	6.4
1000	11.0

The CATV band is approximately 50 to 800MHz. With 200ft of cable, you should see 2.8 to 16dB of loss. While there may be problem at the high channels, all the lower channels should work.

The 4 way splitter has a loss of about -7dB.

Picking a random set top box:
<http://www.zoran.com/IMG/pdf/Simplify_NextGen_STBs_Solutions.pdf>
See Page 3. Sensitivity is -18dBm for 256QAM and -24dBm 64QAM.

At the low end, you have 0dBm in, 7dB loss in the splitter, 2.8dB loss in the coax, resulting in -9.8dBm to the box. That's much more than the -18dBm/-24dBm needed.

However, at the high end, things are not so wonderful. 0dbm in, 7dB loss in the splitter, and 16dB loss in the coax, which delivers -23dBm. That's 1dB of margin, which is not very good. Still, it should work on the lower channels.

Looks like the cable guys screwed up.

a. They should be putting enough signal on that cable to overcome the loss.

b. They should be able to measure the amplitude of pilot signals at your end of the cable and tell you how much above minimums they are.

If all else fails you may need an amp. What Fred means with drop amp is usually called a "mast preamplifier", like this:

http://www.amazon.com/Uhf-Vhf-Antenna-Pre-Amp/dp/B0018CDGEQ/ref=sr_1_20?ie=UTF8&qid=1328748729&sr=8-20

I don't know this particular one but essentially it should be weather-proof. It gets its DC voltage via the coax, from a wall wart that would plug in at your boat. So no need to run a power supply cable up there.

Don't go for too much gain. This dreaded DTV falls apart rather easily on the slightest distortion or cross-modulation. Not sure if the above amp can handle that. You might need a more expensive one. Michael Terrell might know which ones are good. What matters is dynamic range.

Also, make sure you have a perfect 75ohms match at your end. The cable box from the cable company should provide that. if you have Internet and/or phone through them as well check that connection so it doesn't cause reflections. On a boat at sea stuff can corrode quickly.

Oh, and don't dare to watch that boobs channel while your wife's on the boat :-)

--
Regards, Joerg

There should be no water in the cable, it's only a couple of months old and both ends have crimp on connectors and are located in a box or boat.

> Your unspecified cable set top box may also have some user accessible
> diagnostics which include per channel signal levels. You may want to

It does have diagnostics, I'm not sure if it is each channel though.
But I can get some info out of the box. I'll be there Friday and I'll
get that info and the model of the cable set top box.

I'm using Comcast at the boat. We are lucky here (I think) in that
we have a choice of two cable companies.

Drivel is good.

Any idea where channel 428 would be in that frequency range?
That's a duplicate of 4,2 but in HD, and it works when 42 doesn't.
>
> The 4 way splitter has a loss of about -7dB.

Just a point. I may not have made it clear. I had the tech put in two
2way splitters and connect me to the first one. Hoping to gain 3db.
(or 4) and it did make a difference.

I believe that's entirely up to the cable company, you'd have to ask an engineer there.

http://en.wikipedia.org/wiki/Digital_cable

Quote "For example, a cable company might call channel 5-1 "channel 732" and channel 5-2 "channel 733"".

Where does the other leg of that splitter go to? And is that end properly terminated?

>Now remember the problem is quite intermittent, but seems to be happening almost daily for short periods.

Monitor the signal levels at the set top box and see if it coincides with something nearby changing, such as the dock lights or operation of heavy machinery. Maybe shove a DVM (digital voltmeter) into the AC power and see if it moves around.

> There should be no water in the cable, it's only a couple of months old and both ends have crimp on connectors and are located in a box or boat.

I don't like crimp type connectors. Push on connectors are MUCH better. Also, if the coax came from Radio Shack, all bets are off as to the quality.

>It does have diagnostics, I'm not sure if it is each channel though. But I can get some info out of the box. I'll be there Friday and I'll get that info and the model of the cable set top box.

Digital set top box diagnostics are different from analog. Instead of per-channel levels, it might have levels for specific channels.

>   I'm using Comcast at the boat. We are lucky here (I think) in that we have a choice of two cable companies.

If it's Comcast, you will probably still have the lower 72 channels doing analog. Remove the set top box and plug in your TV directly.

right good question...OP, when you had the analog signal, was there significant ghosting?

digital boxes might tolerate a WEAK signal but they are intolerant of reflections.

Mark

I respectfully agree! 8^)

I don't know exactly how it's done now, but when I worked in the Cable
industry many moons ago, we had a lot of adjustment we could make. Even
more, we had variable by frequency attenuators so we could ensure that a
flat signal showed up. There was a lot of signal at the amplifiers, and
if we really needed more oomph, we could put in a distribution amp.
Another amp was really rare.

Yeah, there is something wrong there. For as much as people hate
Comcast, when I had cable internet put in, they replaced all the cable
from the pole to the house, and a lot inside the house. I did talk them
out of replacing the new cable I had put in, but insisted on putting new
connectors on them. The measured all the levels and set them high enough
that I'd be able to add more televisions if I liked.

Time to call the cable company and tell them you want your MTV.

 Why would there be a reflection in a closed cable run?

wrote:

>Any idea where channel 428 would be in that frequency range?
>That's a duplicate of 4,2 but in HD, and it works when 42 doesn't.

Ummm... it's ugly. There are up to 10 standard definition or 2 HD
channels crammed into a 6 MHz wide RF slot. In order to untangle
this, you would need to run a PSIP decoder and extract the CVCT
record:
<http://en.wikipedia.org/wiki/PSIP>
to figure out where digital CH 428 fits. It could literally be
anywhere. However, if you happen to have an tuneable notch filter
(which I happen to have), you can stuff it in series with the cable,
and spin the dial until the signal disappears. Then, just read the
dial. (Comcast seems to be putting well paying and popular channels
on the lower frequencies, and obscure junk on the higher frequencies.
I'm not sure if this is intentional, accidental, or my imagination).

>> The 4 way splitter has a loss of about -7dB.
>
>Just a point. I may not have made it clear. I had the tech put in two
>2way splitters and connect me to the first one. Hoping to gain 3db.
>(or 4) and it did make a difference.

Yeah, I saw that. I guess I wasn't too clear. The input signal can
vary over a 10-16dB range, and it still should work. The 3dB
difference between a two port and a 4 port splitter isn't going to
make much difference, exept at the higher channels.

  I know about "cable trash" cable installers that used to go around to
different cities, working for different cable companies. I know what
corners they cut, and what responsibilities they shirk off.  I know the
difference between them and me.  It is way below my pay grade and way
above YOURS. Compared to you, I am the FADM, and you don't even rate 4-F.
Take your stupidity back to your left hand, putz!

  I post-wired thousands of ports, and that was over 30 years ago, you
fucking retarded twit.  I have done 350' runs through the woods when they
were unable to get the hard line trucks into the area.  That's what
happens when the Bengals GM has his house all the way back in the corner
of an Indian Hills cul de sac. Mr Brown was a big dude too. There were
deep wear tracks in his carpet where the big fucker roamed.  Outside the
tracks, it looked new.

  Did lots of pre-wire too.  Worked for General Instrument for the first
year I was out here in Ca as well.  That was almost twenty years ago,
asswipe.  I was performing instruction for them by the time I left.
The gear FEEDS the cable companies, AND the broadcasters.

  You lose.  As usual... again.

  Said the *TOTAL* fucking retard who doesn't know me, or a goddamned
thing about me.

  I did more last week to make the world a batter place than a putz like
you ever has or ever will in your entire, pathetic life.

  And it was ALL absolutely telecommunications related.

  Yeah, yer battin' 1000 there bub.  NOT!

  I'd bet cash at Vegas that you've never even seen what a 10Gb/s optical
port looks like, much less anything about its operation.

  The only thing about "10" you have familiarity with is YOUR IQ.

  You must be some cable trash asswipe residential hole popper
"installer" wanna be fucktard.

 Yeah, you got the fucktard part right.  Fits you to a "T".

   Stick that up you TAR, K0 boy!  You FUCKING RETARD!  FOAD!

No way to know from here, but they may not be able to add another amp.
```

While I was looking for something else, I lurched into this page:

<http://www.cisco.com/en/US/products/hw/cable/ps2217/products_white_paper0900aecd800fc94c.shtml>

While its intended audience is Internet modem designers, the noise discussions are informative with regard to other signals, too.

My point: When you try stringing too many amps in line, the signal-to-noise ratio (SNR) eventually becomes unacceptable. (Remember the acceptable SNRs cited for 256 QAM and 64 QAM.)

"Sal"

Sorry.   I should have said carrier to noise ratio (CNR), not SNR.  SNR
applies to post-detection signals.  i joined the digital world late in life.

"Sal"

   Well, you could add an amplifier at the splitter where (nominally)
there is no power.
   Use the coax center conductor for power; inline capacitors allow
signal to pass and feeding center via small choke allows DC but no signal.
   Once upon a time there were little adapters that did this AC/DC thing...

Careful! Don't get your dBm mixed up with your dBmV. There's around 48dB
difference! 0dBm is a massive 48dBmV. That would certainly make most
set-top boxes wake up and pay attention!

Hey,

Come on you guys, you forgot again to put a couple of spaces in the name for Tuuk,,, Not very smart. And it is obvious the message didn't come from my server, I don't try to hide.

YOu realize what you did was illegal and unethical, It is called mirrorring or ghosting. By putting someone elses name in the fields as to look as if it were them posting. Not very bright are ya.
But it is illegal, not to mention unethical. Did I mention that?

Feng shui ,, not shei,,, again, not very bright are ya.

And also, it is not a feng shui detector because they do not look like that. Looks more like the cover of a flux capacitor, It is obvious that you haven't lived with a knowledge improved feng shui life,,, oh so obvious.

And what does Feng Shui have to do with my sauna?

Anyway, thanks for thinking about me, and thanks for trying.

The brass object is a sand casting, are those grooves for water? Glue? Prevent it from warping? and the holes for bolts.
What is the other side looking like?

Good luck and 73s

```

Are we talking about the same type of reflector?
I'm thinking about a Parabolic
Trough:http://www.solar-facts.com/light-concentration/parabolic-reflector.php

I thought that this type of reflector just have one polarization plane?

>I'm thinking about a Parabolic Trough:
>http://www.solar-facts.com/light-concentration/parabolic-reflector.php

Nope. Different form factor. I'll see if I can dig out some photos
(a major project). Mine was very different. Visualize taking an
ordinary parabolic dish, and slicing off a chord from opposite sides
of the dish. The result is a large parabolic shape in one axis, and a
much smaller parabolic shape in the other axis. Something like these,
but with a much more radical aspect ratio:
<http://cdn3.explainthatstuff.com/solar-cooker-parabolic-reflector.jpg>
<http://www.greenjoyment.com/images/butterfly-community-solar-cooker.jpg>
<http://www.dipol.com.pl/pict/a72122+.jpg>
As I vaguely recall, one reflector axis was about 15ft, while the
other was about 3ft.

Obviously the gain will be reduced if large parts of the reflector
disappeared. However, if the surface area of the dish were maintained
by adding to the longer axis, most of the lost gain can be recovered.
Note that most of the gain provided by the dish comes from reflections
close to the center axis (near the feed). As the sides of the dish
get steeper, as in a deep dish, the increase in gain per dish area
added becomes less. When the sides of the dish are nearly
perpendicular to the main lobe, no gain is produced at all. Therefore,
a flat dish (large f/D) is a more efficient use of reflector area,
than a deep dish (small f/D).

>I thought that this type of reflector just have one polarization plane?

I'm not sure, but I don't think it matters. As long as the continuous reflective surface is large enough, the reflected signal will not magically convert from circular to elliptical polarization. It will change sense (RHCP to LHCP), but not symmetry. The problem is that I'm having some trouble visualizing how it works and need to think about this for a while.

WEFAX on 1691MHz is circularly polarized as are most satellites.

Well, I don't do that stuff and agree that it is unethical. But, do you
have a cite for "illegal"?

Hi

Yes, thanks for the question. Yes it is illegal.

Its moral or ethical could be overridden by childish,

But its legality is no question.

No, I don't think it necessary to report this to the server's administration, no I just figure the boys are having some fun with me. I had some fun with the boys, now they havin some fun with me.
Touche

Good luck,,, 73s

Anyone here ever used an LDG Z11ProII tuner as a remote tuner? I have one ready to install in a weatherproof box at the base of a ladder-line-fed doublet, which worked well when I used it during field day... but my question: Is the LDG Z11 sensitive to temperature extremes? I could not find anything in the manual about it.

The gods of propagation are fickle. I was just in northern California but wanted to check in with my club's 7183 kHz net in San Diego. I brought a 40m Hustler with some radials. It was all set up and tested around 5:00 PM and I worked two guys 5-7 within twenty miles of home. All good, right?

At 7:30, that band was as dead as I have ever heard it! I had only some foreign broadcasters, including Radio Havana at S9. XMIT VSWR was normal; minimum around 7190 and slowly going up on either side -- same as it was in the afternoon. Just no prop. Hated life. Plus it was damn cold out on that sidewalk. LOL...yeah, that the way it goes.
BTW I have been hearing a lot of signals on 20-10 for the past two days.
The openings come and go, and at times there are ENORMOUS pileups.

Thanks. I downloded this "MMANA-GAL basic" but couldn't find the example

loaded Yagi anywhere in any of the antenna menus. Can you tell me what the
file is called and/or should I have tried out the "pro" version? Thanks,

ARRL Antenna Book has all the answers.

Shortening the antenna will reduce the effective radiated power and will reduce the amount of gathering ability of the antenna.
Every time you reduce the size by 25% - you throw away - probably 50% of it's ability.

Antenna's are always a compromise when you get into the lower ranges.
It is easier to BUY a Mosley tribander - about $1000.00, then to try to make your own.

As the elements are shortened or lengthened, all of the variables has to be recalculated because the spacing will also change and the boom length.

Do you think they used Granit rocks on their sauna?

Maybe their HT needs new batteries.

Any suggestions? Is this Feng Shuie?

Yes it's the basic one, the file is in

\MMANA-GAL_Basic\ANT\HF short

and the file is called

"3el short Yagj W1FBY.maa"

Brian

No offense, but you are not as amusing as you seem to think you are.  As
in - not at all amusing.

You were more amusing, but not much, when you making absurd claims.

tom

Interesting. I don't seem to have either that folder nor file. I'm using
version 3.0.0.25.

Harry

Hey, Thanks for the flowers,

But what do you suppose the emmissions are in these people's home?

Do you think they were twinkled by the fairy god mother? Or is this some natural ground emissions or man made transmission lines under them or are they dreaming this stuff up?

Obviously very serious health concerns.

Any thoughts?

They have serious skin issues
I know you can make a bulb glow anywhere and with anything
I was just curious what the hams thought about it, what would cause this or
these.

Interesting you think it is all in the homeowner's own mind. That is
interesting.

RF does not cause skin issues except at very very high power levels.

I'd love to see video of the glowing bulbs. I simple do not believe it.
  Evidence is needed. Virtually all of these things are hysteria or fraud.

Dreaming, hallucinating, causing anguish for fun.

> reduce the amount of gathering ability of the antenna.

Uhh.. not really. for small scale shortening, the directivity will remain roughly the same. Losses are fairly small, in general, so you don't get a big change between loaded and unloaded (unless you pick a particularly lossy way to load it)

What WILL change is that the dimensional tolerances and bandwidth will be narrower. That is, you won't get the same gain over as wide a band.

You will also not get as good F/B or side/back lobe performance in general.

> Every time you reduce the size by 25% - you throw away - probably 50% of
> it's ability.

I don't think so. Can you demonstrate this with a simple model?

The physical size of a Yagi isn't all that closely related to the effective aperture, at least for 10-20% sorts of size changes. Sure, go to half or quarter size and losses will start to increase because of the increased stored energy.

>

> length.

Yes, but today, you've got a LOT of help from very good and validated modeling codes. No more are you looking at tedious cut and try.

The real thing that's going to affect performance for a small antenna is mechanical details.. how are elements attached, what kind of dimensional tolerances can you hold, how big is the tubing, stuff like that.

One note.. When designing a loaded dipole or yagi, you can
consider it pretty much the same as designing a loaded vertical,
except you have two back to back.
The same rules apply as far as current distribution, etc.
The only difference is the vertical is half an antenna
fed against ground, and the yagi is two verticals back to
back, which form a complete antenna independent of ground.

So.. if you look at the various forms of loaded verticals,
you can apply the same designs to loaded yagi's.
For instance, up to a point, the farther up the vertical
the loading coil is, the better the current distribution
will be. The tradeoff point where the coil losses outweigh
the improved current distribution, which can be modeled, but
is probably around 3/4 the length of the radiator in most
cases. Maybe slightly more.. I checked this one time, but
forgot the best exact location that I came up with..
Been a long time since I did that.
If the loading coils are at the feed point, that
would have the least desirable current distribution with
a vertical, and this will apply also to the elements of a
loaded yagi.

The farther up/out the loading coil is from the feedpoint, the more coil turns you will need to tune. If the world was perfect, and coils had no loss, all the way at the end would be the best place. :/ In the real world, you have to use the best compromise. Which averages about 3/4 the way up/out from the feed in most cases.

You could use the usual antenna modeling program to calculate the performance, but you could also use a vertical design program, such as vertload, and also determine the best place for the loading coils. You could then use the modeling program to design the best spacing for what you want to optimize. IE: most gain, or best f/b, etc.

Placing the coils at 1/2 out from the feedpoint is a fairly good location as far as coil loss, vs current distribution. But if you wanted every last drop of gain, you could go out a bit farther. I probably wouldn't go any farther than 3/4 out though. You can also use capacitive loading hats on the ends of the elements. That will further improve the current distribution, and also slightly reduce the number of coil turns you need.

I want to run a single wire antenna using my AH-4 with my IC-7000 or 706MKII, but living in a 2nd floor apartment, I don't have access to a good ground without having to run a ground wire longer than the antenna wire is going to be! Does anyone have any suggestions on how I can get on the air with this equipment without frying something? I'd appreciate any information/ideas.

Also, I have never had any tattoos before, and was planning on having my daughter's name, (Beth) tattooed on my forearm in Morse as my first. A few days ago I was being set up for radiation treatments where they give you a CT scan and mark, (tattoo) you with three reference dots to aid the radiation techs when they position you and the equipment as they get ready to zap you with it. Anyway, when they did that, I couldn't help but think of them as 3 "E"s tattooed on my chest. One in front, and one on each side. I just thought that amusing.

Anyone else have, or thinking about getting something tattooed in Morse? I'm looking for design ideas. If you know of any pictures on the web, links would be appreciated.

I've been faced with such antenna challenges myself. What bands do you want
to operate? The challenges get bigger with lower frequencies.

I had reasonable luck with a horizontal loop near the ceiling (or in the
attic) fed with open wire line. If you are going to use an outside end-fed
wire, the MFJ artificial ground might help.

Sorry you are having health problems, but you might as well have fun with
whatever you can.
Why not a callsign tattoo...that's what I did (just kidding). Is there any
way to get the dots of your callsign in the right places?

I am thinking a improper ground somewhere causing leaking.
Maybe there is infloor heating with the heat resistive wiring and the
wireing doesn't have proper shielding and it is spewing EMF. Some
manufacturers produce, and brag their selling rights because theirs is 0
EMF. And they do a pretty good job of shielding it.

And EMF if high enough power as you say, will cause mutations in DNA and
cancers and problems. Maybe theirs is high power.

Maybe they have ghosts, they could use my HT 530 to measure, It might even
be able to tell the difference between a leaking infloor electric heater
improperly installed and a ghost.

2nd floor grounds are always a problem. For a friend, I tried a large
piece of welded chicken wire under the carpet. It failed miserably.
Grounding to the plumbing was even worse, as the downstairs neighbors
computer and TV would go nuts due to the radiated RF. Throwing a
heavy copper wire out the window and pounding in a ground rod worked
well, but the condo committee decided that it broke their rules. At
this time, my friend is using various remote HF stations over the
internet.

Been there, done that for prostate cancer. 5 years, and PSA=0. The
hard part is laying still for 20 minutes, while the machine drills
holes in you with protons. Don't worry about side effects. The real
problems are catching a cold or flu in the waiting room, and finding a
parking place.

>Anyone else have, or thinking about getting something tattooed in Morse? I'm

It's just 3 small dots. Try not to gain or lose weight during the
procedure or it will throw their aim off. However, it's not critical
as they run xrays at various points to recalibrate the targets.

As for Morse tattoos, they try to make the target as small as
possible. Adding more targets is not a great idea as they may
accidentally burn a hole in a sensitive place. However, if you must:

I know one of the Daves around here had DORK !!! tattood on his forehead.

Probably to line up their lazer beams aimed at his brain. Certainly would explain a lot.

Anyway, I always figured tattoos to be tabboo and never felt the desire. While putting your daughter's name in code is cool, you will explain it each time to everyone who ask what all those dots are. Could make them flourescent glow in the dark dots. But have too many friends of mine are getting their tattoos removed now. I suppose back then they were done differently, maybe today more safer. Most commendable putting your daughter's name, but remember it is permanent.

Do you have copper cold water pipes in your appt? Could you ground to that with saddle or clamp? Or your outlets on the walls are gounded (probably to that same pipe, off the main box).

Just start off on low power and use that tuner and watch your meters.

If I am not mistaken, I think that unit has a bunch of fuses easily
replaceable, and a nice microphone. Dave had one back in Nam.

   I remember from 40 years ago Gomer Pyle had two dots tattooed on his
arm.  ..
It was going to be a snake but his girl friend stopped him, so all he
got were the eyes. :-)

I said nothing about high power causing anything. You are imagining things.

On cancer and mutations - B as in B, S as in S. Show proof - as in double blind studies, not hearsay, which seems to be your normal mode of operation.

And I would love to know how someone can tell the difference between a heater and a "ghost" using an HT.

Pray tell, explain this to us.

Really.

This should be quite amusing.

Except ultra high power, but that is heating, not mutations or cancer.

You are a perfect representative of current world citizens. You read
something on the net and believe it because you have no scientific or
logic training at all.

This is one reason, among several, why the world economy and society in
general is on a downturn.

If you are typical, which is unfortunately probable, we are all doomed.

Tom

You said """RF does not cause skin issues except at very very high power levels.""

Then you said

"""I said nothing about high power causing anything. You are imagining things."""

Come on Tom

"""Dreaming, hallucinating, causing anguish for fun, it makes no difference. There are no health concerns.""""

These are what you said. Then you turn around and spin like this?

Sorry Tom, you just lost me there.

But then you also said:

""No offense, but you are not as amusing as you seem to think you are. As in - not at all amusing.

You were more amusing, but not much, when you making absurd claims."""

Come on Tom,
Who is amusing who? I think it is you who is making "absurd claims".

And I have proven it beyond a shadow of a doubt.

And yes, I can prove that EMF causes health problems, easily, you said they don't.

hmmmmmmmmmmm

73s

I have a friend now who is having a big face removed from his arm. It is a
```

big proceedure to have this thing removed and has taken over a year so far and big bubble blisters and long process and probably expensive and avoidable. The eyes were different colors so much more complicated and painful.

But putting your daughter's name there is commendable because that is a life long thing. But morese code, well what if you are not a Ham for life? I know some hams who say they are hams who couldn't spell ham. I know some ham wanna bees, and I know a lot of good hams, real hams. Some go, some come and go, some just hang around like a linguring odour.

What made you think of this? Is this pier thing? All your friends have some tattoos? Your papa? Some like to become 2nd or 3rd generation doers, I understand that, I am like that. But it is your choice,,,

Couldn't you just put her name on your shoulder? Like a sea captain puts an anchor on his arm?

Good luck with your decisions and treatments and what it is to do.
